

Accounting

Libro de estudio y repaso

53 indicadores · 53 mapas de relaciones · 265 casos resueltos

Lea para comprender; practique para comprobar

Estudie la explicación, lea cada flecha del mapa como una relación y resuelva los cinco casos antes de consultar la solución. Compare su razonamiento con la respuesta, identifique el dato que decide el caso y vuelva al concepto que necesite reforzar.

Los capítulos siguen la tabla oficial DGEC 2026. El número anterior a los dos puntos distingue el bloque de la matriz; no reemplaza la numeración oficial del indicador. Los casos son material didáctico original y no reproducen las pruebas pro de la plataforma.

Accounting conserva los bloques en español e inglés de su tabla. Contabilidad (3010) dispone de otro libro y otro banco. Los rótulos explicativos de bloques sin encabezado se identifican como editoriales.

Índice de indicadores

1:1.1 Cuentas, saldos y ecuación patrimonial	3
1:2.1 Libro diario y soporte de transacciones	5
1:3.1 NIIF en una empresa de servicios	6
1:4.1 Mercancías, IVA y declaración del período	8
1:5.1 Ajustes: diferidos y acumulados	9
1:6.1 Para qué sirve el marco conceptual	11
1:6.2 Aplicación contable en una empresa comercial	12
1:7.1 Concepto, alertas y marco preventivo de la Ley 8204	14
1:7.2 Señales de alerta y respuesta documentada	15
2:1.1 Obligaciones de patronos y personas trabajadoras	17
2:2.1 IVA y tributos sobre bienes: leer la norma correcta	18
2:2.2 Cálculo y registro con bases tributarias explícitas	20
3:1.1 Healthy habits when working with computers	21
3:1.2 Computer hygiene and safe everyday use	23

3:2.1 Computer viruses and other malicious software	24
3:2.2 Comparing anti-malware protection	26
3:3.1 Devices, connections and services	27
4:1.1 Approaches to improving organizations	29
4:2.1 Marketing and value for customers	30
4:3.1 The four variables of the marketing mix	32
4:4.1 Professional conduct at a business meal	33
4:5.1 Components of compound interest	35
4:5.2 Calculating compound amounts and present values	36
5:1.1 Factoring receivables and financing cost	37
5:2.1 Accounts payable and supplier obligations	39
5:2.2 Foreign-currency payables and exchange differences	40
5:3.1 Inventory according to business activity	42
5:3.2 Why inventory requires adjusting entries	43
5:4.1 The role of property, plant and equipment	45
5:4.2 Measuring, depreciating and disposing of equipment	46
5:5.1 Accounts within equity	48
5:5.2 Classifying and reconciling equity changes	49
5:6.1 Savings and loan associations	51
5:7.1 Working capital and cash-flow information	52
5:7.2 Controls over working capital	54
5:8.1 Cash-based and working-capital-based funds statements	55
5:8.2 Calculating changes in working capital and cash	57

5:9.1 Tools for financial statement analysis	58
5:9.2 Interpreting financial ratios	60
6:1.1 Leadership in a small or medium enterprise	61
6:2.1 Inventory systems, lead time and storage	62
6:3.1 Standard cost rates and cost cards	64
6:4.1 Continuous production and process costing	65
6:4.2 Summarizing production costs	67
6:5.1 Joint products, co-products and by-products	68
6:5.2 Methods for allocating joint costs	70
7:1.1 Physical and mental workload	71
7:1.2 Workload effects on people and productivity	73
8:1.1 Ethical principles in auditing	74
8:2.1 Internal control over company accounts	76
8:2.2 Evaluate control situations and corrective action	77
8:3.1 Projected profit and loss statements	79
8:3.2 Methods for forecasting sales	80

1:1.1 Cuentas, saldos y ecuación patrimonial

Contabilidad · Décimo

Propósito: Resuelve situaciones relativas a las cuentas y sus componentes.

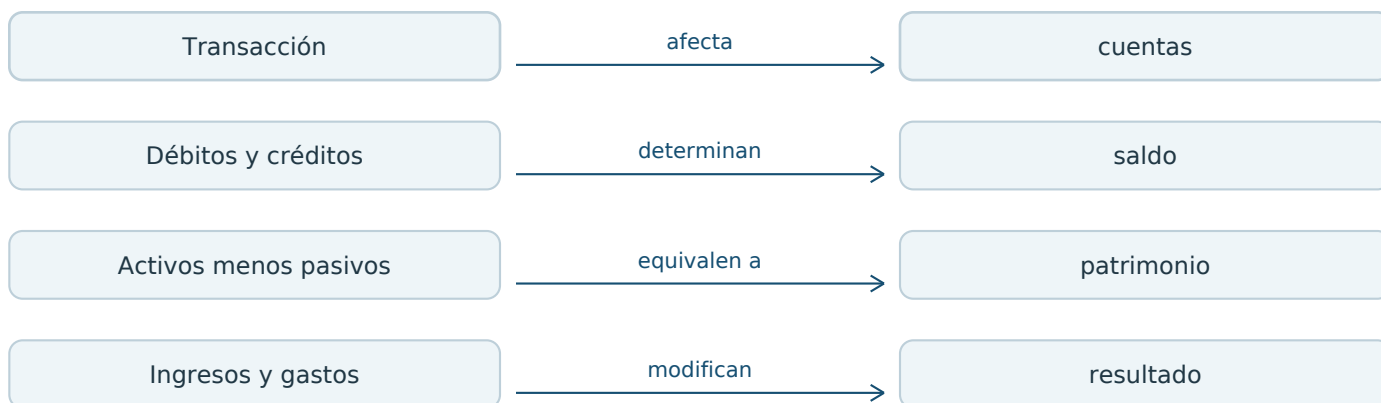

Representar el efecto económico

Una cuenta reúne movimientos de un mismo elemento y permite conocer su saldo. Activo representa recursos económicos controlados; pasivo, obligaciones presentes; patrimonio, la parte residual. La ecuación $\text{activo} = \text{pasivo} + \text{patrimonio}$ se conserva porque cada transacción tiene efectos compensados. Ingresos y gastos modifican el resultado y, por esa vía, el patrimonio; aportes y distribuciones de propietarios se distinguen de ese resultado. El nombre de una cuenta debe describir su contenido, no solo el documento que la originó.

Debe y haber

Debe y haber son lados del registro, no sinónimos de bueno y malo ni de entrada y salida de dinero. En cuentas ordinarias, activos y gastos aumentan al debe; pasivos, patrimonio e ingresos aumentan al haber. Las disminuciones se anotan en el lado contrario. Una cuenta correctora, como depreciación acumulada, tiene naturaleza opuesta a la cuenta que corrige. El saldo resulta de comparar débitos y créditos. Un balance de comprobación cuadrado solo prueba igualdad aritmética: todavía puede haber cuentas equivocadas, omisiones o errores de período.

Mapa conceptual explicado

La ecuación explica el equilibrio; la naturaleza de cada cuenta explica en qué lado se registra.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Una entidad tiene activos de 950 y pasivos de 370. ¿Cuál es su patrimonio?

Solución razonada. 580. $950 - 370 = 580$.

2. Caso 2 · Aplicación guiada

Caja registra débitos por 700 y créditos por 250, sin saldo inicial. ¿Qué saldo presenta?

Solución razonada. Saldo deudor de 450. Una cuenta de activo queda deudora cuando sus débitos superan los créditos.

3. Caso 3 · Aplicación guiada

¿Qué movimiento aumenta normalmente una cuenta de ingresos?

Solución razonada. Un crédito. Los ingresos tienen naturaleza acreedora.

4. Caso 4 · Préstamo

La empresa recibe 200 de un banco y debe devolverlos.

Solución razonada. Aumentan caja y pasivo en 200. No es ingreso por ventas ni aporte del propietario.

5. Caso 5 · Correctora

Equipo tiene costo 600 y depreciación acumulada 150.

Solución razonada. Su importe neto es 450, sin otros ajustes. La depreciación acumulada reduce el activo y normalmente tiene saldo acreedor.

Fuentes para ampliar y cotejar

IFRS Foundation. Conceptual Framework.

1:2.1 Libro diario y soporte de transacciones

Contabilidad · Décimo

Propósito: Resuelve situaciones de transacciones contables en el libro diario.

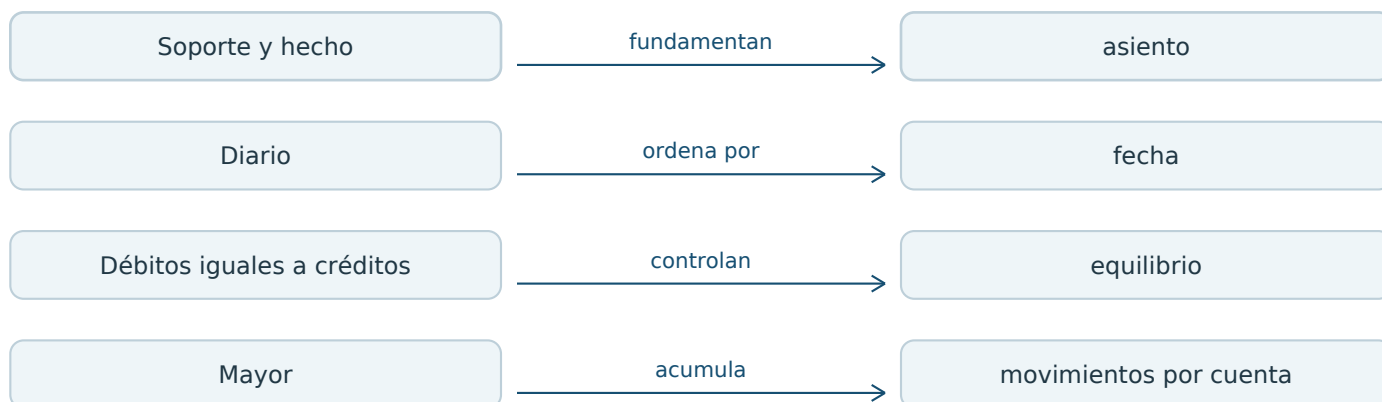

Del hecho al asiento

Antes de registrar se identifican fecha, entidad, hecho económico, importe, soporte y cuentas afectadas. El diario organiza asientos cronológicamente con débitos, créditos y una explicación. Cada asiento debe equilibrarse, pero ese control se acompaña de revisión del fundamento. Pagar una obligación ya reconocida no crea otra vez el gasto que la originó. Cobrar una cuenta por cobrar no genera nuevamente el ingreso. El devengo separa reconocimiento económico y movimiento de efectivo.

Revisar sin borrar la historia

Un sistema conserva referencia al comprobante y trazabilidad de correcciones. La persona que registra verifica autorización y evita duplicar documentos recibidos por distintos canales. Los asientos se trasladan al mayor para acumular saldos por cuenta; el mayor no reemplaza el soporte. Si una factura se recibió en otro período, se analiza cuándo ocurrió el hecho y qué ajuste corresponde, sin cambiar arbitrariamente fechas para lograr un resultado. Los ejemplos omiten impuestos cuando lo indican para concentrarse en la lógica de las cuentas.

Mapa conceptual explicado

El registro representa el hecho; el pago o cobro posterior cancela la cuenta pendiente sin repetir el resultado.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Se compra equipo por 800 al contado, sin impuestos en el caso. ¿Qué asiento corresponde?

Solución razonada. Débito a equipo 800 y crédito a caja 800. Aumenta el equipo y disminuye efectivo, sin alterar patrimonio.

2. Caso 2 · Aplicación guiada

Se cobran 300 de una cuenta por cobrar ya registrada. ¿Qué asiento corresponde?

Solución razonada. Débito a caja 300 y crédito a cuentas por cobrar 300. Se transforma un activo en otro; no se repite la venta.

3. Caso 3 · Aplicación guiada

Se paga a un proveedor una deuda registrada por 450. ¿Qué cuenta se debita?

Solución razonada. Cuentas por pagar. El débito reduce el pasivo que se está cancelando.

4. Caso 4 · Compra a crédito

Se reciben materiales por 120 y se pagarán después; se omiten impuestos.

Solución razonada. Se debita inventario de materiales y se acredita cuentas por pagar por 120. La ausencia de pago no elimina el hecho.

5. Caso 5 · Duplicado

La misma factura llega por correo y por una carpeta compartida.

Solución razonada. Se comprueba identificador y registro previo antes de contabilizar; dos canales no representan dos compras.

IFRS Foundation. Conceptual Framework.

IFRS Foundation. IFRS 15 Revenue from Contracts with Customers.

1:3.1 NIIF en una empresa de servicios

Contabilidad · Décimo

Propósito: Reconoce las NIIFs usadas en operaciones mercantiles de una empresa de servicios.

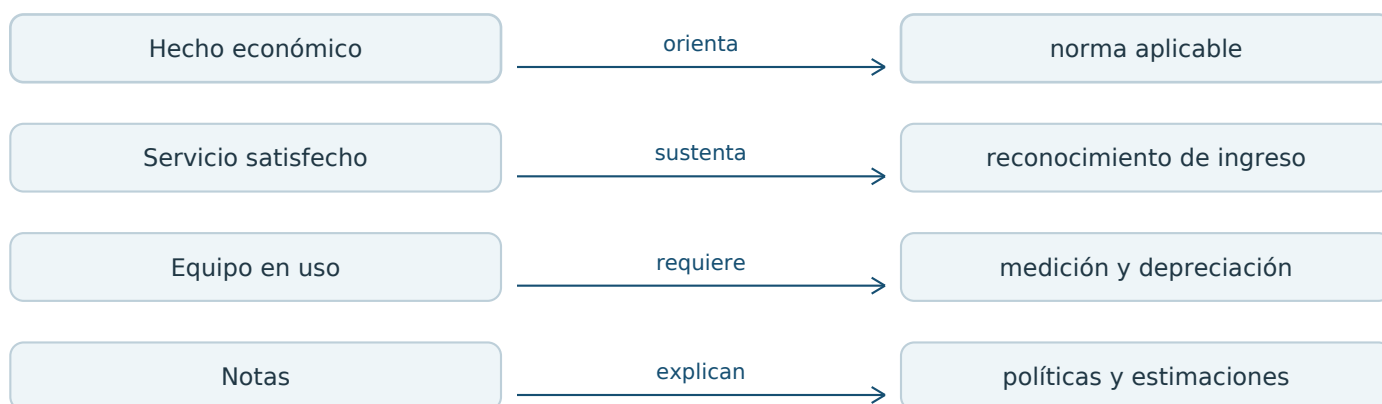

Elegir la norma según el hecho

Una empresa de servicios puede tener ingresos por contratos, equipos, activos intangibles, obligaciones y estimaciones, además de efectivo. El marco contable aplicable se define antes de elaborar estados; no se mezclan arbitrariamente NIIF completas y NIIF para PYMES. Dentro de NIIF completas, NIIF 15 orienta ingresos de contratos con clientes; NIC 16, propiedades, planta y equipo; NIC 38, intangibles; y NIC 37, provisiones y contingencias. El nombre de la norma es un punto de entrada: después se analiza su alcance y los hechos del caso.

Reconocimiento y evidencia

Prestar un servicio y cobrarlo pueden ocurrir en fechas distintas. Un anticipo no es ingreso ganado por el solo hecho de recibir dinero; se examinan las obligaciones de desempeño. Comprar equipo para varios períodos tampoco implica reconocer todo como gasto inmediato: se estudian reconocimiento, vida útil y depreciación. Una expectativa favorable no basta para registrar cualquier activo, ni una inquietud vaga justifica cualquier provisión. Las notas explican políticas, estimaciones e información relevante. Estos casos introductorios aportan los supuestos necesarios; no sustituyen el análisis íntegro de contratos complejos.

Mapa conceptual explicado

La norma se selecciona por la transacción, no solo por el sector de la empresa.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Una consultora analiza cuándo reconocer ingresos por un contrato con un cliente bajo NIIF completas. ¿Cuál es la referencia principal?

Solución razonada. NIIF 15. NIIF 15 trata ingresos de contratos con clientes.

2. Caso 2 · Aplicación guiada

Un cliente paga antes de que se preste el servicio contratado. ¿Qué debe evitarse?

Solución razonada. Reconocer automáticamente todo como ingreso ganado al cobrar. El ingreso depende del cumplimiento pertinente, no solo del cobro.

3. Caso 3 · Aplicación guiada

¿Qué información aportan las notas a los estados financieros?

Solución razonada. Políticas, estimaciones y explicaciones relevantes para interpretar cifras. Las cifras necesitan contexto para representar adecuadamente los hechos.

4. Caso 4 · Consumo del activo

Un equipo cuesta 2400, tiene residual cero y vida estimada de cuatro años; se usa línea recta por años completos.

Solución razonada. El cargo anual del modelo es $2400 \div 4 = 600$. Se distingue inversión inicial y consumo por uso.

5. Caso 5 · Incertidumbre

Existe una reclamación, pero la información no permite concluir que toda cantidad reclamada deba provisionarse.

Solución razonada. Se evalúan obligación, probabilidad, medición y revelación según la norma; no se registra mecánicamente todo lo solicitado.

DGEC. Tabla oficial 2026, especialidad 3001, página 3.

IFRS Foundation. IFRS 15 Revenue from Contracts with Customers.

IFRS Foundation. Conceptual Framework.

1:4.1 Mercancías, IVA y declaración del período

Contabilidad · Décimo

Propósito: Realiza cálculos sobre operaciones con mercancías y el cálculo del impuesto de ventas y la declaración respectiva.

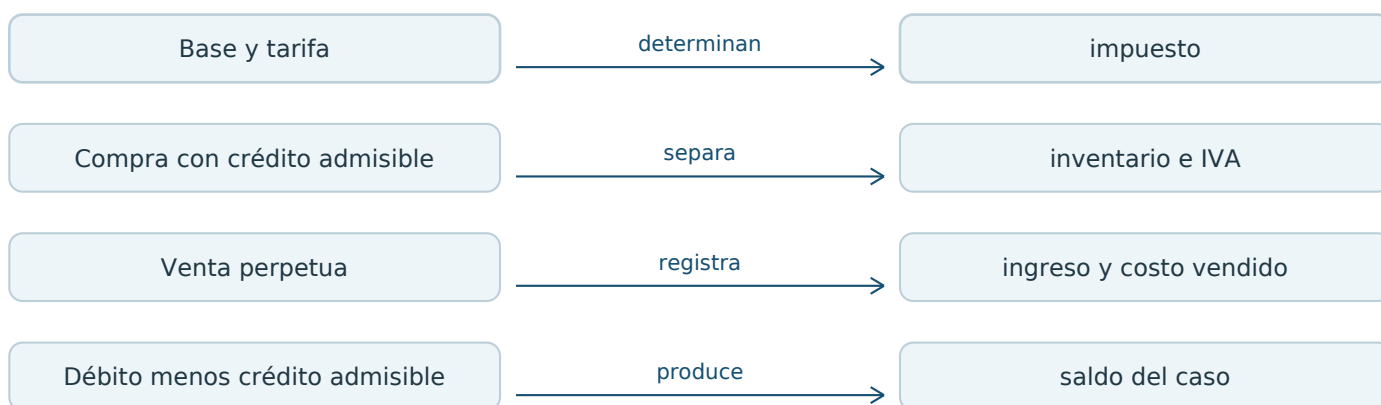

Separar mercancía e impuesto

La tabla conserva el término histórico impuesto de ventas. Para los casos actuales se distingue el IVA y se utiliza la tarifa expresamente suministrada; no se supone que toda operación tenga igual tratamiento. En una compra con crédito fiscal plenamente admisible, el inventario se registra por su base y el IVA recuperable por separado. Si el tributo no es recuperable, su tratamiento depende de la naturaleza de la adquisición. En un sistema perpetuo, una venta de mercancías tiene un registro del ingreso e impuesto y otro de salida del inventario a costo.

Del comprobante a la declaración

Débito fiscal de ventas menos crédito admisible de compras, con ajustes aplicables, determina el saldo del ejercicio. El precio final que incluye un impuesto proporcional se divide entre uno más la tarifa para obtener la base; restar directamente ese porcentaje al total da una base incorrecta. Se concilian facturas, notas y registros antes de declarar. Presentar y pagar son actos distintos; cada uno requiere su comprobación. Estos ejercicios fijan condiciones didácticas y no intentan reemplazar reglas vigentes para operaciones con exenciones o limitaciones especiales.

Mapa conceptual explicado

La declaración utiliza registros conciliados; impuesto cobrado y utilidad no son el mismo concepto.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Se compran mercancías con base 1000 e IVA del caso de 13 %, totalmente recuperable. ¿Cuánto se carga a inventario?

Solución razonada. 1000. El IVA recuperable de 130 se separa del costo de mercancías.

2. Caso 2 · Aplicación guiada

Una venta tiene precio final 2260, incluido IVA del 13 %. ¿Cuál es la base?

Solución razonada. 2000. $2260 \div 1,13 = 2000$.

3. Caso 3 · Aplicación guiada

Débito fiscal 780 y crédito plenamente admisible 520, sin otros ajustes. ¿Cuál es el saldo por pagar?

Solución razonada. 260. $780 - 520 = 260$.

4. Caso 4 · Sistema perpetuo

Se vende mercancía con base 500 y costo 320; el caso fija IVA 13 %.

Solución razonada. Se reconoce cobro o cuenta por cobrar 565, ingreso 500 e IVA 65. Además, costo de ventas 320 contra inventario 320.

5. Caso 5 · Comprobación

La declaración aparece presentada, pero no existe constancia de pago de un saldo exigible.

Solución razonada. Se verifica por separado si se canceló o aplicó el medio válido. Presentar la declaración no acredita automáticamente pago.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 3.

Ministerio de Hacienda. Comprobantes electrónicos.

1:5.1 Ajustes: diferidos y acumulados

Contabilidad · Décimo

Propósito: Resuelve situaciones de ajuste, relacionados con los ingresos y gastos diferidos y acumulados.

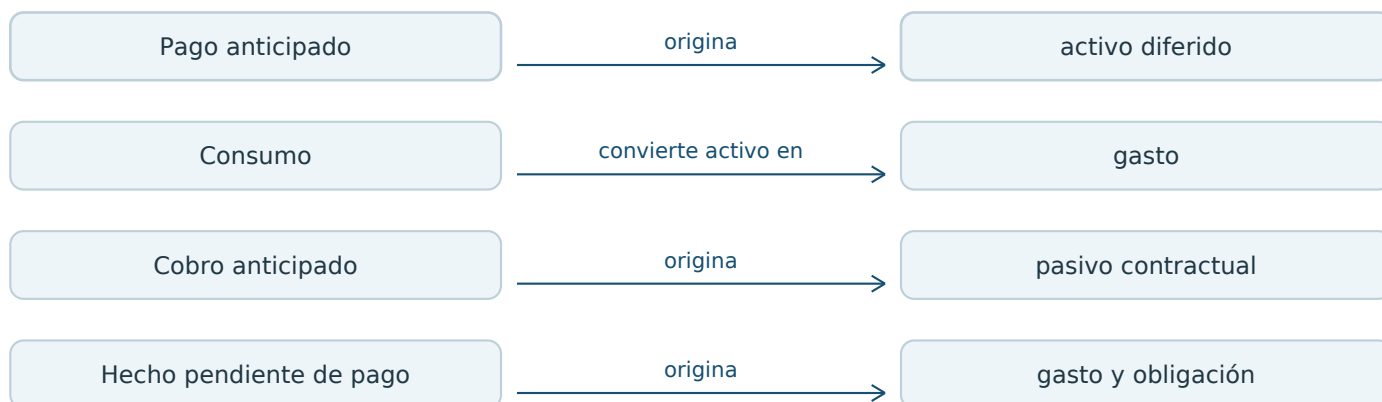

Asignar al período correcto

El ajuste reconoce ingresos y gastos en el período que corresponde, aunque cobro o pago ocurra antes o después. Un gasto pagado por anticipado comienza como activo cuando representa un beneficio futuro; la parte consumida se reconoce como gasto. Un ingreso cobrado antes de cumplir la obligación comienza como pasivo; la parte ganada reduce ese pasivo y aumenta ingreso. En cambio, un gasto acumulado ya ocurrió y sigue pendiente de pago; un ingreso acumulado ya se ganó y sigue pendiente de cobro.

Medir la porción devengada

Se identifican fecha de inicio, período cubierto y consumo o cumplimiento real. Una cobertura uniforme puede distribuirse por meses, pero no toda obligación se satisface linealmente: se usa el criterio indicado en el caso. Los ajustes de devengo habituales no mueven caja en la fecha de cierre. Se concilian saldos iniciales, adiciones y porciones consumidas para evitar ajustar dos veces. Haber recibido una factura tarde no convierte automáticamente el gasto en el período siguiente. El soporte y la fecha del hecho guían el reconocimiento.

Mapa conceptual explicado

La pregunta decisiva es qué parte se ganó o consumió, no solamente cuándo se cobró o pagó.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Se paga seguro de 1200 por doce meses uniformes y transcurren tres. ¿Qué gasto acumulado debe reconocerse?

Solución razonada. 300. $1200 \div 12 \times 3 = 300$.

2. Caso 2 · Aplicación guiada

Se recibieron 900 por un servicio de tres meses que se cumple uniformemente. Al cierre ha transcurrido un mes. ¿Cuánto ingreso se reconoce?

Solución razonada. 300. Se ganó un tercio del servicio: $900 \div 3$.

3. Caso 3 · Aplicación guiada

Un alquiler anticipado tiene saldo 1000 antes de ajustar y se consumieron 250. ¿Qué saldo del activo queda?

Solución razonada. 750. El consumo reduce el activo: $1000 - 250$.

4. Caso 4 · Interés acumulado

El caso fija deuda 10000, interés simple anual 12 % y un mes devengado no pagado.

Solución razonada. Se reconoce gasto e interés por pagar por $10000 \times 0,12 \div 12 = 100$. El principal no aumenta por un pago que aún no ocurrió.

5. Caso 5 · Cierre doble

Una factura de electricidad ya se incluyó como gasto acumulado y luego llega el documento definitivo por igual monto.

Solución razonada. Se cancela o reclasifica la obligación al registrar el documento; no se vuelve a reconocer el mismo gasto.

IFRS Foundation. Conceptual Framework.

IFRS Foundation. IFRS 15 Revenue from Contracts with Customers.

1:6.1 Para qué sirve el marco conceptual

Contabilidad · Décimo

Propósito: Describe la importancia del marco conceptual de las NIIFs en las operaciones de una empresa comercial.

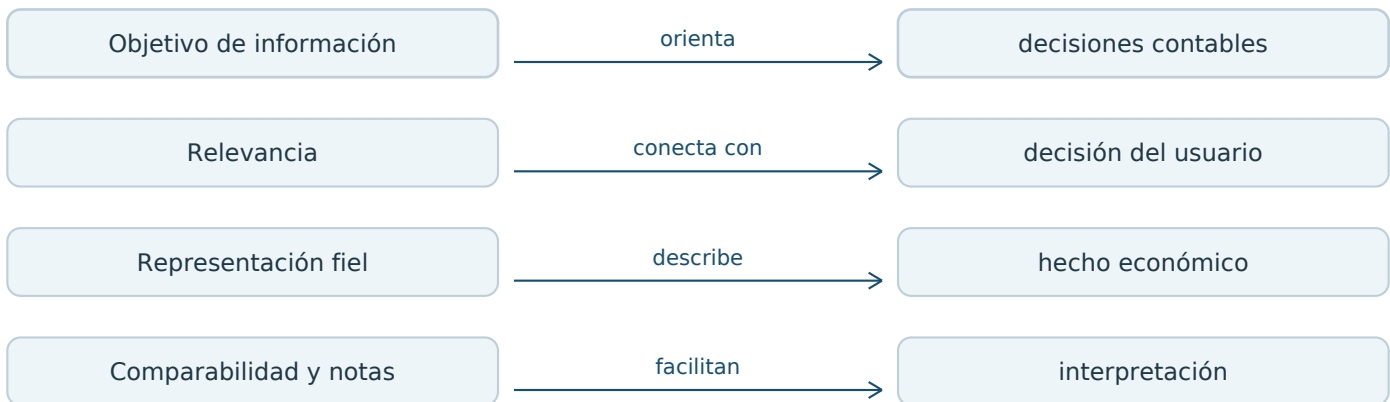

Información para decidir

El marco conceptual explica objetivos, conceptos y criterios generales de la información financiera. Ayuda a comprender activos, pasivos, patrimonio, ingresos y gastos, y orienta decisiones de política en ausencia de una norma que regule específicamente el hecho. No es una autorización para ignorar una norma aplicable. La información útil debe ser relevante y representar fielmente el fenómeno. La importancia relativa depende de naturaleza, magnitud y contexto; una misma cantidad puede tener efectos diferentes en entidades distintas.

Calidad y límites

Representar fielmente exige describir el hecho de forma completa, neutral y libre de error en el proceso pertinente; no significa que toda estimación tenga precisión absoluta. Comparabilidad, verificabilidad, oportunidad y comprensibilidad mejoran la utilidad. Ser comprensible no exige ocultar un asunto complejo necesario. La prudencia apoya juicios cuidadosos bajo incertidumbre sin introducir sesgo deliberado. Distinguir entidad y propietario evita tratar retiros personales como gastos de operación. La información tiene costo, pero ahorrar trabajo no justifica omitir hechos decisivos.

Mapa conceptual explicado

El marco conecta conceptos y utilidad; las normas particulares aportan requisitos para transacciones específicas.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

¿Qué función cumple el marco conceptual cuando existe una norma específica aplicable?

Solución razonada. Ayuda a entenderla, sin reemplazar sus requisitos. El marco no prevalece sobre una norma que regula la transacción.

2. Caso 2 · Aplicación guiada

¿Qué cualidades fundamentales se asocian con información financiera útil?

Solución razonada. Relevancia y representación fiel. Las cifras deben importar para decisiones y representar el hecho adecuadamente.

3. Caso 3 • Aplicación guiada

¿Por qué la importancia relativa no se decide solo con una cifra universal?

Solución razonada. Porque también depende de la naturaleza y el contexto del hecho. Magnitud y naturaleza se evalúan en las circunstancias de la entidad.

4. Caso 4 • Propietario

El dueño paga con caja de la empresa una compra exclusivamente personal.

Solución razonada. Se identifica un retiro o cuenta pertinente con el propietario, según el caso. No se convierte en gasto operativo por usar la caja empresarial.

5. Caso 5 • Estimación

Una pérdida esperada se estima con datos razonables y se explica su incertidumbre.

Solución razonada. La existencia de estimación no hace inútil la información; interesa un proceso adecuado, neutral y transparente.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 3.

IFRS Foundation. Conceptual Framework.

1:6.2 Aplicación contable en una empresa comercial

Contabilidad • Décimo

Propósito: Aplica las NIIFs, en las operaciones y estados financieros para una empresa comercial.

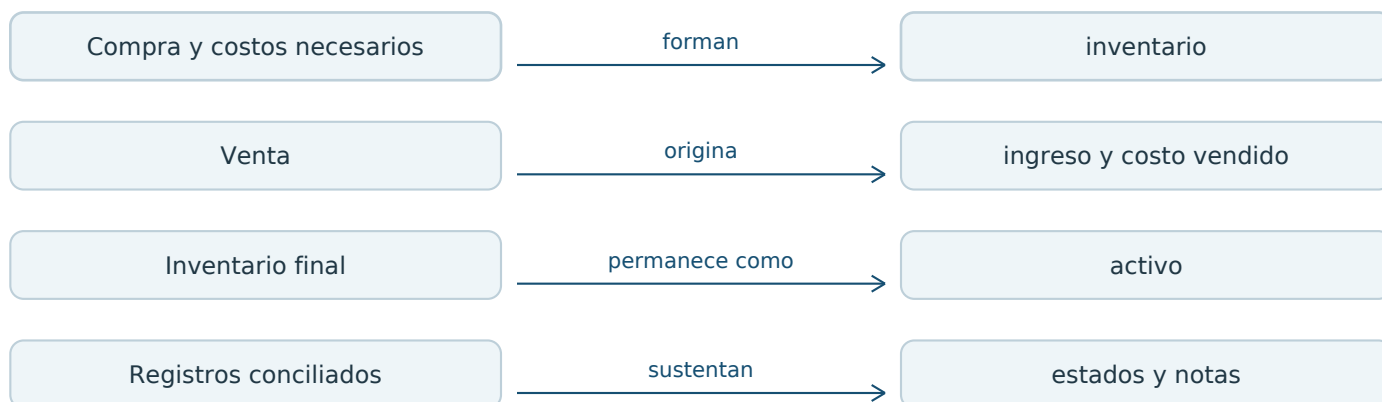

Reconocer la operación completa

Una empresa comercial adquiere mercancías para venderlas. Debe distinguir inventario, ingreso por venta, impuesto cobrado y costo de la mercancía vendida. Bajo sistema perpetuo, vender genera dos efectos relacionados: ingreso según el contrato y salida del activo a gasto. Los descuentos comerciales reducen el precio de compra; costos necesarios para llevar el inventario a su ubicación y condición pueden integrar su costo. No se incorpora publicidad posterior solo porque ayude a vender. El caso define qué impuestos son recuperables y qué condiciones aplican.

Presentar con coherencia

Las cifras del estado de situación financiera y del resultado se relacionan mediante registros y ajustes. El inventario final no es ingreso; sigue siendo activo hasta venderse o hasta otro hecho que exija ajuste. La medición considera costo y valor neto realizable según la norma aplicable. Clasificar una deuda depende de sus condiciones y vencimiento, no del deseo de mostrar mejores razones financieras. Las notas comunican políticas y circunstancias materiales. Conciliar auxiliar de inventario, mayor y conteo físico ayuda a detectar diferencias antes de preparar estados.

Mapa conceptual explicado

La mercancía pasa de activo a gasto cuando se vende; se conserva la trazabilidad entre ambos momentos.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Mercancías con precio 1000, descuento comercial 100 y flete necesario 50; sin impuestos. ¿Cuál es el costo?

Solución razonada. 950. $1000 - 100 + 50 = 950$.

2. Caso 2 · Aplicación guiada

Se vende por 800 una mercancía cuyo importe registrado es 500, sin otros gastos ni impuestos. ¿Cuál es la utilidad bruta?

Solución razonada. 300. Ingreso 800 menos costo de venta 500 = 300.

3. Caso 3 · Aplicación guiada

Una mercancía no vendida al cierre conserva costo recuperable. ¿Dónde se presenta normalmente?

Solución razonada. Como inventario en el activo. La existencia no vendida mantiene su condición de activo.

4. Caso 4 · Descuento

Un proveedor reduce el precio comercial antes del reconocimiento de la compra.

Solución razonada. Se registra el costo neto correspondiente; no se inventa un ingreso por el valor de lista que nunca se pagará.

5. Caso 5 · Conteo

El auxiliar muestra 50 unidades y el conteo verificado encuentra 47.

Solución razonada. Se investiga el origen y se ajusta con soporte cuando corresponda; cambiar solo la cifra de la hoja oculta el efecto contable.

DGEC. Tabla oficial 2026, especialidad 3001, página 3.

IFRS Foundation. Conceptual Framework.

IFRS Foundation. IAS 2 Inventories.

1:7.1 Concepto, alertas y marco preventivo de la Ley 8204

Contabilidad · Décimo

Propósito: Identifica los alcances, etapas, consecuencias y señales de alerta de la legitimación de capitales.

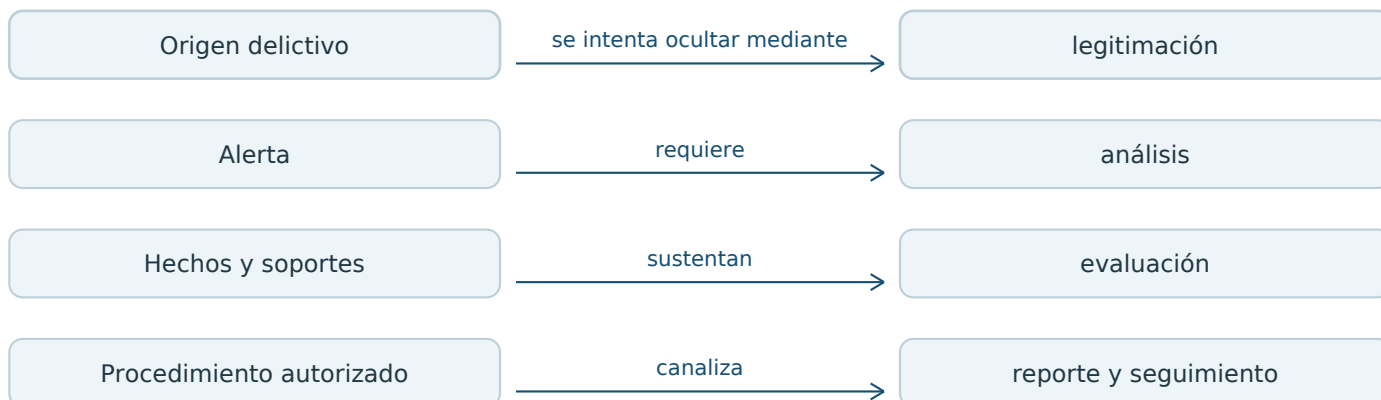

Comprender el fenómeno

La legitimación de capitales busca ocultar o dar apariencia lícita a bienes procedentes de actividad delictiva. Como modelo de estudio se distinguen colocación, estratificación e integración; en casos reales pueden superponerse y no siempre aparecen como una secuencia visible. El marco costarricense de la Ley 7786, reformada integralmente por la 8204 y reformas posteriores, aborda drogas, actividades conexas, legitimación de capitales y financiamiento del terrorismo. No se limita a transacciones bancarias ni a una sola fuente delictiva.

Alertas y responsabilidades

Una operación incompatible con el perfil económico, documentación contradictoria o resistencia injustificada a identificar beneficiarios puede requerir análisis. Una alerta no es prueba suficiente de delito. El responsable registra hechos, revisa soportes y escala por los procedimientos aplicables, protegiendo confidencialidad y evitando avisos indebidos al interesado sobre reportes. Las obligaciones concretas dependen de la actividad y condición de sujeto obligado; no se inventan umbrales universales. Los ejemplos enseñan detección y control, no formas de ocultación.

Mapa conceptual explicado

El modelo explica el fenómeno; el trabajo preventivo exige analizar evidencia sin convertir una señal en condena.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

¿Qué describe la legitimación de capitales?

Solución razonada. Ocultar o dar apariencia lícita a bienes de origen delictivo. El elemento relevante es la relación con origen delictivo y su ocultación o apariencia de legitimidad.

2. Caso 2 · Aplicación guiada

¿Qué conjunto corresponde al modelo de etapas usado para estudiar lavado de activos?

Solución razonada. Colocación, estratificación e integración. Son categorías analíticas; no siempre se observan como etapas rígidas y separadas.

3. Caso 3 • Aplicación guiada

Una operación es inusual para el perfil del cliente. ¿Qué significa inicialmente?

Solución razonada. Que requiere análisis según el procedimiento, no que el delito esté probado. La alerta inicia una revisión proporcional y documentada.

4. Caso 4 • Coherencia

El soporte de una operación contradice su propósito declarado.

Solución razonada. Se solicita o verifica información pertinente y se registra la inconsistencia. La conclusión debe basarse en el análisis y canalizarse según las obligaciones aplicables.

5. Caso 5 • Alcance

Un empleado cree que solo los bancos pueden tener obligaciones preventivas.

Solución razonada. Debe revisarse la actividad y regulación de la entidad. Existen sujetos obligados de diversas actividades; el nombre de la empresa no resuelve su condición.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 3.

ICD. Concepto y etapas del lavado de activos.

ICD. Sistema de registro y reporte de sujetos obligados.

GAFI. Recomendaciones y enfoque basado en riesgo.

1:7.2 Señales de alerta y respuesta documentada

Contabilidad • Décimo

Propósito: Resuelve situaciones relativas a la legitimación de capitales.

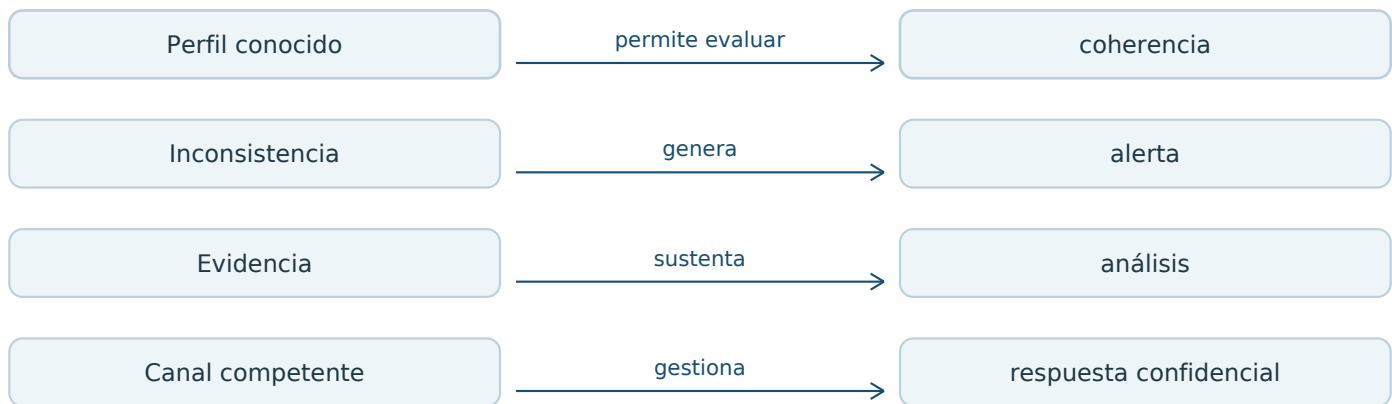

Alerta no es prueba

Una operación incongruente con la actividad, falta de explicación del origen de fondos, terceros sin relación aparente o documentos contradictorios puede justificar análisis. Ninguna característica aislada acredita un delito. El conocimiento de la contraparte, su actividad y beneficiario final ayuda a evaluar coherencia. La Ley 7786, reformada entre otras por la 8204, y las disposiciones según el tipo de sujeto orientan deberes de prevención. No toda empresa tiene idénticas obligaciones de reporte.

Escalar sin alterar registros

Se documentan hechos verificables, fechas y soportes, se preserva confidencialidad y se utiliza el canal interno o legal competente. El personal contable no inventa una venta para justificar un depósito ni acusa públicamente al cliente. Tampoco divide movimientos para eludir controles. La evaluación puede producir requerimientos de información, revisión reforzada o reporte por quien corresponda. Incumplir controles expone a riesgos legales, económicos y reputacionales; una alerta correctamente atendida protege tanto a la entidad como a las personas involucradas.

Mapa conceptual explicado

El objetivo es aclarar y gestionar el riesgo con evidencia, sin convertir una sospecha en conclusión automática.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Una empresa recibe fondos de un tercero desconocido para cancelar una factura ajena. ¿Qué corresponde inicialmente?

Solución razonada. Verificar relación, propósito y soporte conforme al procedimiento. La incongruencia exige análisis y documentación, no presunciones definitivas.

2. Caso 2 · Aplicación guiada

¿Cuál afirmación distingue una alerta de una prueba?

Solución razonada. La alerta motiva evaluación; no demuestra por sí sola un delito. El juicio debe basarse en evidencia y competencias correspondientes.

3. Caso 3 · Aplicación guiada

¿Cómo debe manejarse información sobre una operación que requiere revisión?

Solución razonada. Por canales autorizados y con confidencialidad. La información sensible debe limitarse a quienes intervienen legítimamente.

4. Caso 4 · Contradicción

El contrato describe asesoría, pero la factura y el pago se refieren a maquinaria.

Solución razonada. Se solicita aclaración documentada y se escala la inconsistencia. No se adapta el concepto contable solo para hacer coincidir importes.

5. Caso 5 · Seguimiento

Una explicación inicial no resuelve la diferencia entre actividad y movimientos.

Solución razonada. Se conserva la trazabilidad de consultas y respuestas y se aplica el nivel de revisión previsto; cerrar el caso sin fundamento deja el riesgo sin atender.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 4.

ICD. Unidad de Inteligencia Financiera y prevención de legitimación de capitales.

2:1.1 Obligaciones de patronos y personas trabajadoras

Contabilidad · Undécimo

Propósito: Contrasta las obligaciones de patronos y trabajadores ante la Caja Costarricense del Seguro Social (C.C.S.S). y el Código de Trabajo.

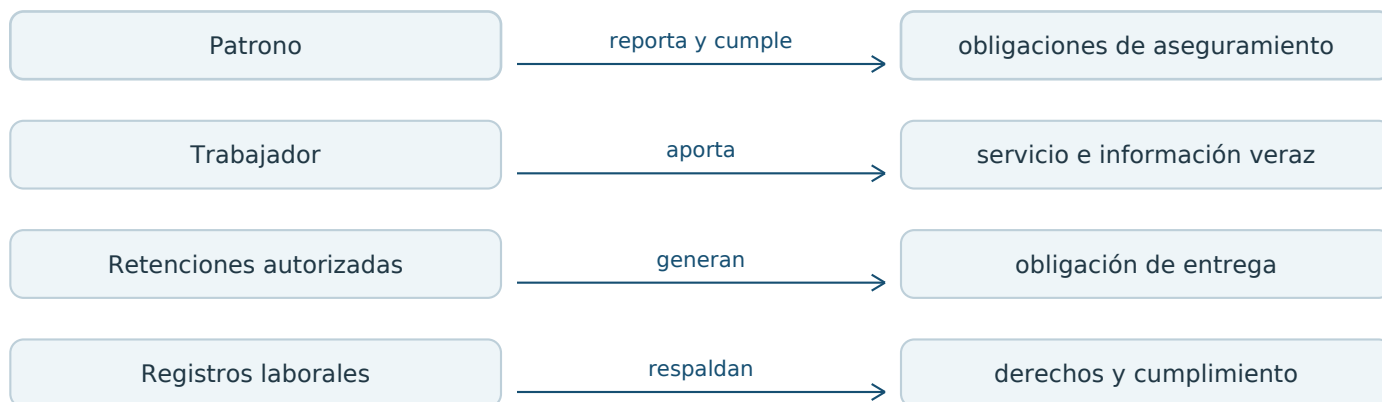

Responsabilidades diferentes

La persona empleadora debe cumplir obligaciones de aseguramiento, reporte de salarios y pago de cargas que correspondan, además de salario y condiciones laborales exigibles. Debe distinguir su propia contribución de los montos que retiene válidamente al trabajador: retener no significa que ese dinero le pertenezca. La persona trabajadora debe prestar el servicio con la diligencia convenida, seguir instrucciones legítimas y medidas de seguridad, y facilitar información veraz necesaria para su registro. Los deberes de una parte no eliminan los de la otra.

Documentación y protección

El registro de jornada, remuneración, incidencias y planillas respalda cumplimiento. Ocultar parte del salario o declarar datos ficticios puede afectar derechos y obligaciones; el acuerdo privado de no asegurar no elimina una obligación legal. La protección de seguridad social se distingue del seguro de riesgos del trabajo. También deben respetarse derechos como descansos y trato digno. Una orden de falsear documentos no se vuelve legítima por venir de una jefatura. Las tasas, bases y plazos se consultan en la fuente vigente; en cálculos didácticos se usan únicamente los datos suministrados.

Mapa conceptual explicado

La planilla conecta remuneración y obligaciones; ocultar datos distorsiona ambas.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Una empresa descuenta del salario una cuota autorizada para seguridad social. ¿Qué debe hacer con ese importe?

Solución razonada. Enterarlo a la entidad correspondiente según el procedimiento aplicable. La retención origina una obligación, no un recurso propio disponible sin destino.

2. Caso 2 · Aplicación guiada

El patrono propone reportar solo la mitad del salario real. ¿Qué corresponde?

Solución razonada. Mantener información veraz y corregir el reporte según el procedimiento. El reporte debe representar la remuneración que corresponde declarar.

3. Caso 3 • Aplicación guiada

Un trabajador entrega datos falsos para su identificación en la planilla. ¿Qué deber afecta?

Solución razonada. Suministrar información veraz necesaria para el registro. Los datos correctos permiten atribuir cotizaciones y derechos.

4. Caso 4 • Bases distintas

Una hoja mezcla el salario neto pagado con la base de cálculo exigida para una contribución.

Solución razonada. Se identifica la base aplicable antes de usar la tarifa. Neto, bruto y base contributiva no son términos intercambiables.

5. Caso 5 • Evidencia

Una persona denuncia que sus salarios reportados no coinciden con los comprobantes de pago.

Solución razonada. Se cotejan registros y se tramita la revisión ante los canales competentes. No se altera la evidencia para cerrar la diferencia.

2:2.1 IVA y tributos sobre bienes: leer la norma correcta

Contabilidad • Undécimo

Propósito: Reconoce lo referente la normativa del Impuesto sobre las Ventas y el Impuesto sobre Bienes Muebles.

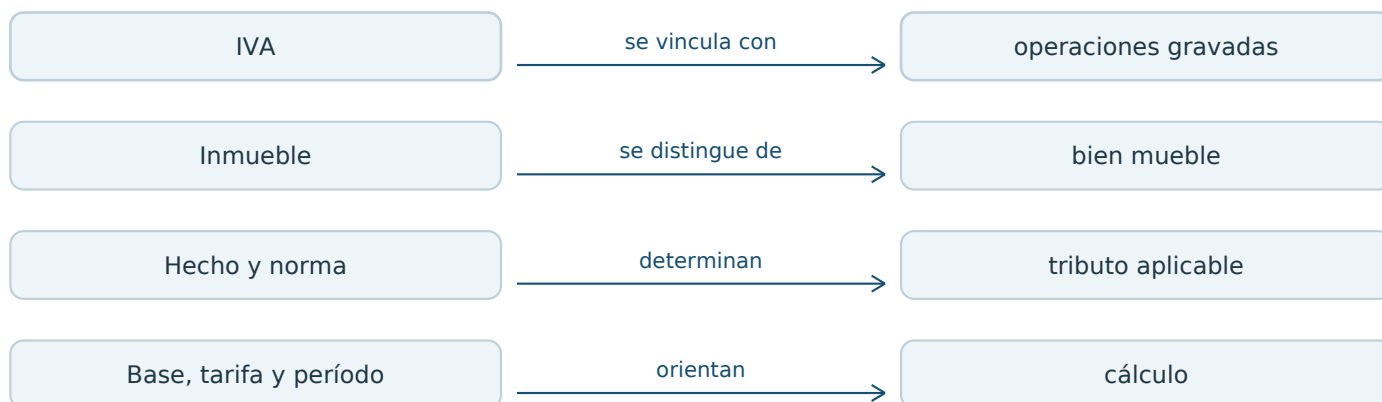

Aclaración de la tabla oficial

La página 4 de la tabla de Accounting 2026 utiliza bienes inmuebles en el resultado de aprendizaje y bienes muebles en las evidencias 2.1 y 2.2. Además, su nota 2 indica referirse al IVA al mencionar impuesto de ventas. Se conserva esa diferencia documental y no se afirma que muebles e inmuebles sean sinónimos. El docente debe cotejar la interpretación curricular con el programa correspondiente. Para estudiar sin inducir error, cada ejercicio identifica expresamente el bien, el tributo y las condiciones; no se infiere una ley solo por un rótulo ambiguo.

Hechos imponible diferentes

IVA se relaciona con operaciones gravadas de venta de bienes y prestación de servicios según su régimen. El impuesto sobre bienes inmuebles de la Ley 7509 se refiere a propiedad inmobiliaria y tiene administración municipal. Un vehículo es bien mueble y puede estar sujeto a un régimen específico de propiedad; eso no lo convierte en terreno ni autoriza aplicar la tarifa inmobiliaria. Comprar, poseer y transferir son hechos distintos y pueden tener reglas diferentes. Para cualquier cálculo se identifica sujeto, hecho, base, tarifa, período, exención si procede y autoridad. Un recibo que reúne varios cargos no convierte todos en el mismo impuesto.

Mapa conceptual explicado

La discrepancia curricular se hace visible; el análisis tributario utiliza hechos expresamente definidos.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

¿Qué distinción es correcta al estudiar tributos?

Solución razonada. Vender un bien y poseerlo pueden constituir hechos gravados diferentes. La obligación depende del hecho imponible y de su norma.

2. Caso 2 · Aplicación guiada

Un vehículo y un terreno aparecen en el registro de activos. ¿Qué debe evitarse al calcular sus tributos?

Solución razonada. Aplicarles automáticamente la misma norma por ser ambos activos. La clasificación contable como activo no iguala su régimen tributario.

3. Caso 3 · Aplicación guiada

¿Qué institución administra el impuesto sobre bienes inmuebles dentro de su ámbito territorial?

Solución razonada. La municipalidad correspondiente. La administración municipal se distingue de otros regímenes tributarios.

4. Caso 4 · Recibo

Un cobro del vehículo reúne impuesto, seguro y otros cargos.

Solución razonada. Se separan conceptos y destinatarios; el total no equivale automáticamente al impuesto de propiedad.

5. Caso 5 · Referencia histórica

Un material antiguo usa impuesto de ventas y una tabla actual pide referirse al IVA.

Solución razonada. Se estudia la regla vigente de IVA que corresponda, identificando el cambio de referencia; no se trasladan mecánicamente viejas condiciones.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 4.

Ministerio de Hacienda. TRIBU-CR y servicios tributarios.

2:2.2 Cálculo y registro con bases tributarias explícitas

Contabilidad · Undécimo

Propósito: Calcula la resolución de situaciones que involucren el cálculo y registro del impuesto sobre ventas y el Impuesto sobre Bienes Muebles.

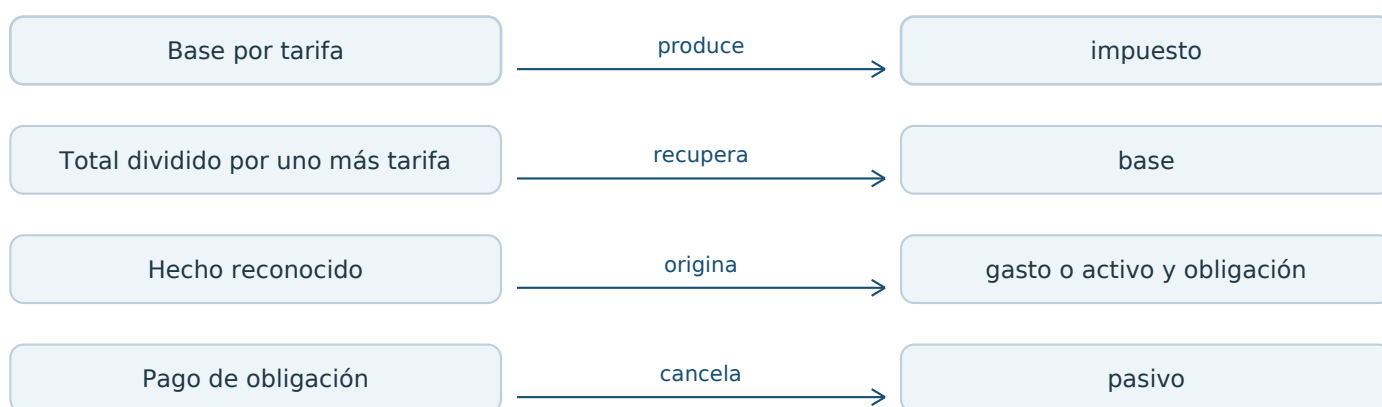

Calcular antes de registrar

Se lee si el importe es base o total incluido el impuesto. Si la base es B y la tarifa proporcional es t, impuesto = $B \times t$; total = $B \times (1+t)$. Si se da el total, base = $\text{total} \div (1+t)$. En tributos de propiedad, el caso puede suministrar una base fiscal distinta del costo contable o del precio de venta. No se sustituye una por otra sin fundamento. Cuando la obligación es anual, dividirla en cuotas no cambia automáticamente su importe anual.

Registrar según naturaleza

IVA recuperable de una compra se registra separado cuando se cumplen las condiciones del caso; IVA cobrado origina una obligación frente a la administración. Un impuesto de propiedad del período puede reconocerse como gasto y pasivo, según los hechos y marco aplicable, y su pago cancela el pasivo sin repetir el gasto. La discrepancia muebles/inmuebles de la tabla se explica en el capítulo anterior; aquí cada caso define expresamente la operación y una regla didáctica. Se conservan soporte, período y conciliación; la tarifa dada es un supuesto del ejercicio, no una afirmación de vigencia general.

Mapa conceptual explicado

La misma multiplicación puede servir a tributos distintos; sus bases y asientos no se vuelven iguales.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Una venta tiene base 8000 y tarifa IVA del caso de 13 %. ¿Cuál es el total facturado?

Solución razonada. 9040. $8000 \times 1,13 = 9040$.

2. Caso 2 · Aplicación guiada

Un ejercicio de propiedad inmobiliaria da base fiscal 20000000 y tarifa anual supuesta de 0,25 %. ¿Cuál es el tributo anual?

Solución razonada. 50000. $20000000 \times 0,0025 = 50000$. Se usa la regla suministrada.

3. Caso 3 · Aplicación guiada

Se paga un impuesto del período por 700 que ya estaba reconocido como pasivo. ¿Qué asiento evita duplicar el gasto?

Solución razonada. Débito al impuesto por pagar y crédito a efectivo por 700. El pago cancela una obligación registrada previamente.

4. Caso 4 · Valor distinto

Un bien cuesta contablemente 12000000, pero el ejercicio fija base fiscal 15000000 y tarifa 1 %.

Solución razonada. Se calcula 150000 según la base fiscal dada, no 120000 usando el costo contable. La tarifa es hipotética.

5. Caso 5 · Cuotas

El impuesto anual del caso es 80000 y se permite pagarlo en cuatro cuotas iguales sin recargos.

Solución razonada. Cada cuota es 20000. El total anual permanece 80000; la periodicidad de pago no crea otro impuesto.

Ministerio de Hacienda. TRIBU-CR y servicios tributarios.

3:1.1 Healthy habits when working with computers

Computing · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Recognize appropriate habits to work with computers.

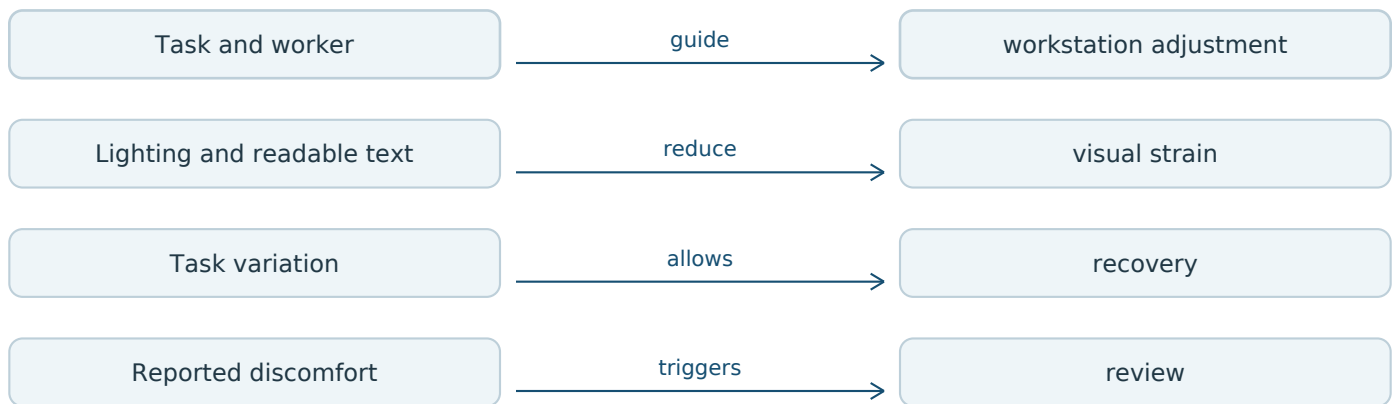

Fit the workstation to the task

Computer work combines visual attention, repeated movements and periods of sitting. A suitable arrangement keeps frequently used items within comfortable reach, supports the body and allows posture changes. Adjust the chair, keyboard and screen together rather than forcing the body to fit one fixed position. Reflections and very small text may encourage awkward leaning. Increase readable text size and improve lighting without exposing confidential records on a larger public screen.

Organize work and recovery

Alternate tasks when possible and take appropriate short breaks from continuous screen work. A break is not simply changing from a work monitor to a phone while keeping the same posture. Report persistent discomfort and review the work arrangement through the appropriate workplace channel. Keep cables away from walkways and leave ventilation openings clear. Good habits also include saving work, following shutdown procedures and planning deadlines so that avoidable last-minute pressure does not replace a workable routine. An ergonomic checklist supports assessment but does not guarantee that one setting suits everyone.

Mapa conceptual explicado

A useful habit changes the conditions of work, not just the worker's willingness to tolerate discomfort.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

An accountant leans forward to read tiny figures. What should be tried first?

Solución razonada. Improve text size and screen arrangement for comfortable reading. The arrangement should support the task instead of forcing an awkward posture.

2. Caso 2 · Aplicación guiada

Which habit helps during prolonged computer work?

Solución razonada. Vary tasks and take suitable short breaks. Recovery and variation reduce continuous exposure to the same demands.

3. Caso 3 · Aplicación guiada

A power cable crosses a busy walkway. What is the appropriate response?

Solución razonada. Route or secure it safely so it does not create a trip hazard. A functioning device does not make its surroundings safe.

4. Case 4 · Shared desk

Two workers of different heights use the same desk.

Solución razonada. Each checks and adjusts the available chair and screen settings. A previous user's arrangement is not automatically suitable.

5. Case 5 · Persistent discomfort

Discomfort continues despite a small adjustment.

Solución razonada. Report it through the workplace process and seek an appropriate assessment rather than relying on repeated guesswork.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 5.

NIOSH. Hierarchy of Controls.

3:1.2 Computer hygiene and safe everyday use

Computing · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Apply hygiene and security habits when using a computer.

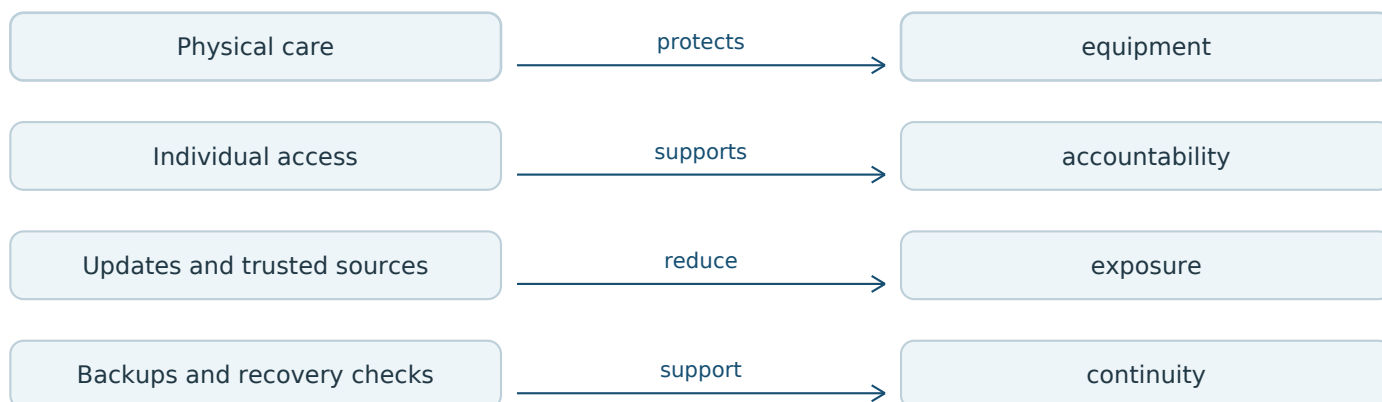

Protect equipment and information

Physical care and information security support each other. Keep drinks away from equipment, preserve ventilation and follow the manufacturer's cleaning instructions. Do not spray liquid directly into openings or attempt electrical repairs outside your training. In a shared office, lock the session when leaving and use individual accounts. Sensitive payroll data should be accessible only to authorized people, even when everyone works in the same department.

Use controlled procedures

Install approved updates, use trusted software sources and report suspicious messages. Backups need protection and a tested recovery process; a second copy on the same failing drive is not a resilient recovery plan. When an incident is suspected, follow the organization's response procedure instead of deleting evidence or testing an unknown file on another work computer. Safe behavior also includes checking recipients before sending records and using approved transfer methods. A clean keyboard does not imply secure data, and a strong password does not prevent physical damage.

Mapa conceptual explicado

Hygiene covers both the device and the way information is handled.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A payroll clerk leaves the desk for a meeting. What should happen to the active session?

Solución razonada. It should be locked before leaving. Locking reduces unauthorized access during the absence.

2. Caso 2 · Aplicación guiada

How should a computer be cleaned?

Solución razonada. Follow the manufacturer's instructions and keep liquids out of openings. Cleaning must avoid electrical and equipment damage.

3. Caso 3 · Aplicación guiada

A file from an unexpected sender asks the user to enable active content. What is the safer action?

Solución razonada. Verify the message through an approved channel and follow reporting procedures. The message and attachment must be evaluated before potentially unsafe execution.

4. Case 4 · Backup

A folder is copied to another folder on the same damaged disk.

Solución razonada. Both copies can be lost in one failure. Recovery planning needs an appropriately separated and protected copy.

5. Case 5 · Recipient

A spreadsheet contains salaries and an email address is suggested automatically.

Solución razonada. Check the intended authorized recipient before sending; autocomplete is not an access decision.

NIST. Small Business Cybersecurity Corner.

3:2.1 Computer viruses and other malicious software

Computing · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Define the concept and characteristic of viruses.

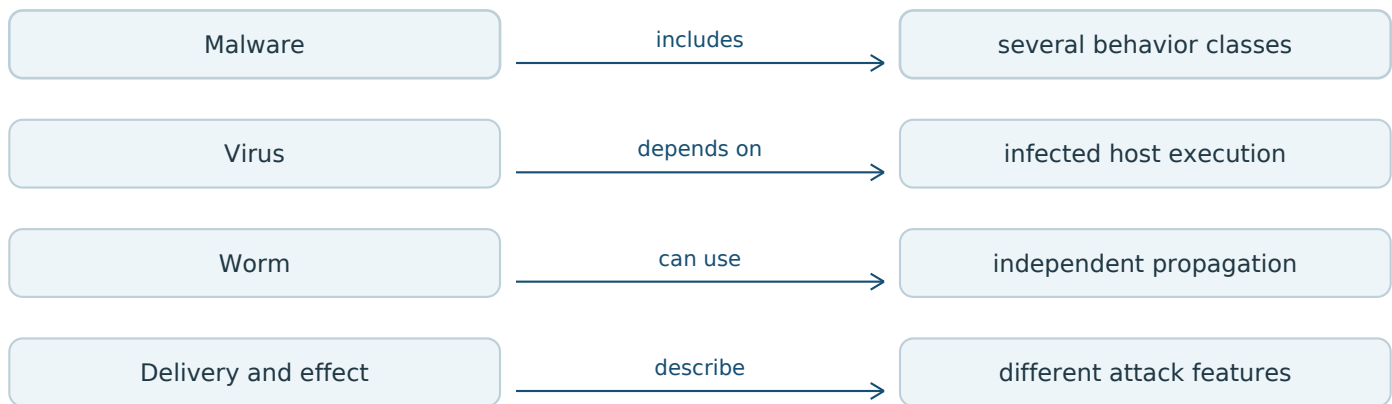

Classify by behavior

Malware is a broad category of software intended to perform harmful or unauthorized actions. A computer virus inserts or attaches its code to a host and replicates when the infected host is executed under suitable conditions. A worm can spread independently, often through network weaknesses, without the same host-file dependency. A Trojan deceives the user about its purpose; automatic self-replication is not required. These labels describe different features and a single attack may combine more than one technique.

Separate delivery and effect

An attachment is a delivery vehicle, not a guarantee that the payload is a virus. Ransomware describes an extortion-related effect such as encrypting files; spyware describes covert information collection. A slow computer is not proof of infection because hardware, workload or configuration can also cause slowness. Diagnosis uses evidence and approved tools. Prevention combines updates, access limits, cautious handling and recoverable backups. The student should identify the behavior actually stated rather than choose a label solely because the scenario mentions an email.

Mapa conceptual explicado

A classification is justified by the described mechanism; a symptom alone may have several causes.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Malicious code is inserted into executable files and runs with the infected file. Which category best describes that replication mechanism?

Solución razonada. A computer virus. The host-file dependency identifies the virus mechanism.

2. Caso 2 · Aplicación guiada

What distinguishes a worm from the virus mechanism described in basic classifications?

Solución razonada. A worm can propagate independently without attaching to a host file. Independent propagation is the key distinction, not the name of the affected application.

3. Caso 3 · Aplicación guiada

A program secretly collects browser activity and sends it to another party. Which label describes its main purpose?

Solución razonada. Spyware. Its purpose is covert collection and disclosure of information.

4. Case 4 · Several labels

A deceptive installer delivers code that encrypts documents and demands money.

Solución razonada. Trojan describes the deceptive delivery; ransomware describes the extortion-related payload. The question must specify the classification feature.

5. Case 5 · Slow device

A computer runs slowly after opening many large files.

Solución razonada. Investigate evidence rather than declaring a virus solely from slowness; several nonmalicious causes are possible.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 5.

NIST. Small Business Cybersecurity Corner.

3:2.2 Comparing anti-malware protection

Computing · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Differentiate characteristics of different anti virus.

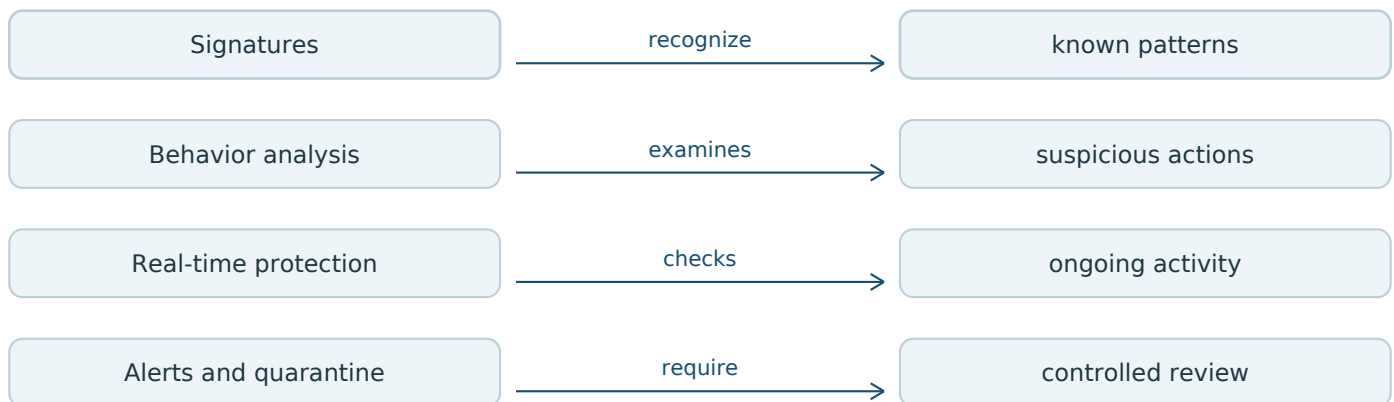

Different detection methods

Signature-based detection looks for known patterns; behavior-based or heuristic methods evaluate suspicious characteristics or actions. Updated information improves recognition of known threats, while additional methods may help detect unfamiliar ones. Neither method guarantees perfect detection. Real-time protection checks activity as it happens; an on-demand scan checks selected data when requested. An organization compares coverage, compatibility, management features, update support and resource use instead of selecting software only by an attractive label.

Interpret results responsibly

A false positive flags a harmless object; a false negative misses a harmful one. Quarantine isolates a suspected object for controlled handling and is not the same as unrestricted deletion. Follow the approved process before restoring an item or adding an exclusion. Running multiple competing real-time engines may create conflicts and must follow supported configurations. Protection complements patching, least privilege and recovery measures. A successful scan reports what the tool detected under its conditions; it does not prove that every possible threat is absent.

Mapa conceptual explicado

Tool features and their limits should be compared together.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which feature checks suspicious activity while files are used?

Solución razonada. Real-time protection. Real-time monitoring operates during activity rather than only on request.

2. Caso 2 · Aplicación guiada

A harmless accounting utility is flagged as malicious. What is this called?

Solución razonada. A false positive. The alert is positive while the object is not malicious.

3. Caso 3 · Aplicación guiada

Why are detection updates important?

Solución razonada. They can improve recognition of newly documented threats. Updated detection is one layer within a broader security process.

4. Case 4 · Quarantine

A protection tool isolates a suspicious attachment.

Solución razonada. Keep it isolated and follow review procedures. Restoring it merely because it is inconvenient defeats the control.

5. Case 5 · Procurement

Two products have similar names, but one lacks supported centralized management needed by the organization.

Solución razonada. Compare operational requirements and supported features, not only marketing names or price.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 5.

NIST. Small Business Cybersecurity Corner.

3:3.1 Devices, connections and services

Computing · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Distinguishes characteristics, functions and services for different devices.

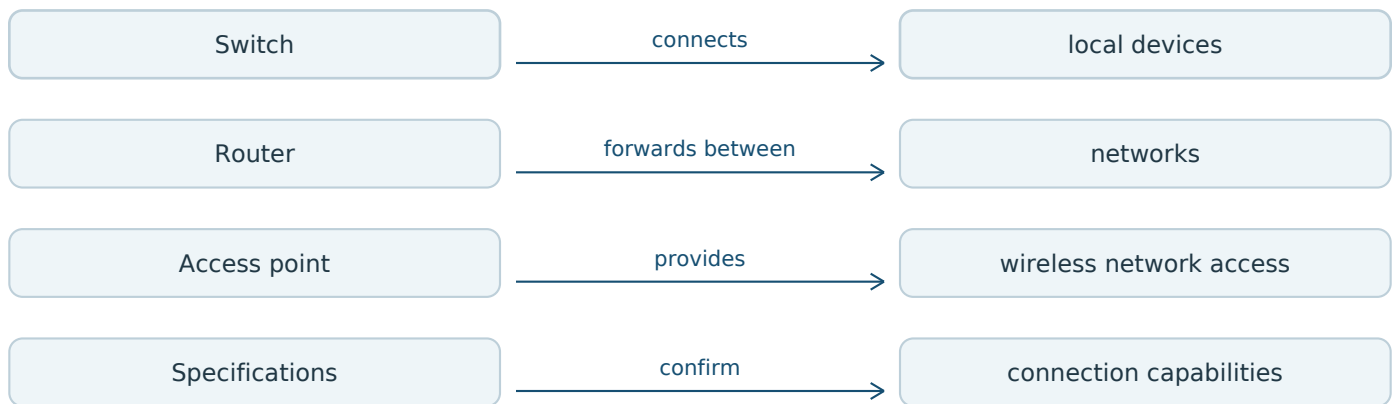

Separate the device from the service

A switch connects devices within a local network; a router forwards traffic between networks; a wireless access point connects compatible wireless devices to a network. A single home or office appliance may combine these roles, but the functions remain different. Wi-Fi describes local wireless connectivity and does not by itself guarantee Internet access. Cellular connectivity uses a mobile operator's network, while Bluetooth commonly connects nearby peripherals. The appropriate choice follows range, bandwidth, power and security requirements.

Check capability before connecting

A connector shape does not guarantee every protocol, display function or charging capability. Check the device, cable, adapter and port specifications together. Storage capacity, memory and network speed describe different resources; increasing one does not automatically solve a shortage in another. A mobile hotspot shares an available connection under its configuration and service conditions. Pair peripherals only with authorized devices, and avoid exposing sensitive accounting data through an unapproved connection. Troubleshooting starts by identifying which local link or remote service is actually failing.

Mapa conceptual explicado

A working local connection and an available remote service are separate conditions.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which device normally forwards packets between an office network and another network?

Solución razonada. A router. Routing connects different networks and selects packet forwarding paths.

2. Caso 2 · Aplicación guiada

Which technology commonly connects a nearby wireless mouse to a laptop?

Solución razonada. Bluetooth. Bluetooth supports short-range peripheral connections.

3. Caso 3 · Aplicación guiada

Two cables have USB-C connectors. What should be checked before using one for an external display?

Solución razonada. The supported capabilities of the cable, port and devices. Connector shape alone does not establish video support.

4. Case 4 · Different bottleneck

A computer lacks memory while processing a large file, and someone proposes a faster Internet plan.

Solución razonada. Identify the local memory constraint. A faster external connection does not directly add RAM.

5. Case 5 · Combined appliance

One office box supplies wireless access, switching and routing.

Solución razonada. Identify the role involved in the fault rather than assuming that one physical device performs only one function.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 5.

NIST. Small Business Cybersecurity Corner.

4:1.1 Approaches to improving organizations

Business foundations · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Differentiates the new theories used to manage the modern organizations.

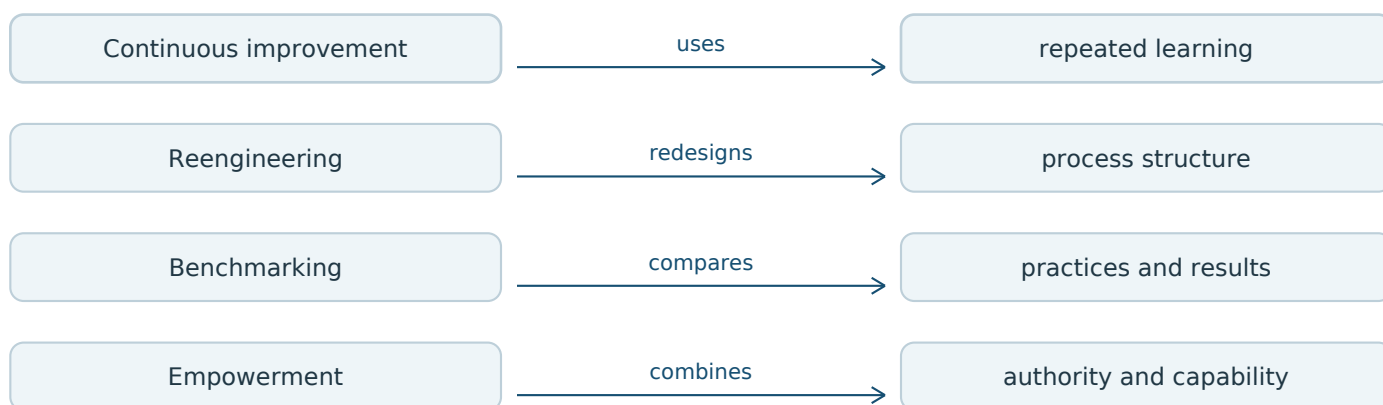

Identify the kind of change

Continuous improvement uses repeated, evidence-based changes to improve a process. Total quality management extends responsibility for quality across the organization rather than leaving it only to final inspection. Business process reengineering examines a process fundamentally and may redesign its flow substantially. Benchmarking compares practices and results with appropriate references to identify opportunities; it does not mean copying a competitor without understanding differences. These approaches address different questions and can complement one another.

Authority, resources and systems

Empowerment gives people defined authority, information and capability to make decisions within boundaries; abandoning them without resources is not empowerment. Outsourcing obtains a function from an external provider while retaining responsibility for selection, oversight and relevant obligations. A systems view examines connections among departments: making one unit faster may only move a queue elsewhere. The choice depends on the problem, evidence and constraints. A new management label is not proof of improvement; define expected effects and check quality, time, cost and consequences for people.

Mapa conceptual explicado

Choose an approach because it addresses the problem, then evaluate its results.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A team measures invoice errors, tests a small change and checks whether errors fall. Which approach is most evident?

Solución razonada. Continuous improvement. The team learns through measured incremental changes.

2. Caso 2 · Aplicación guiada

An organization compares its order-processing practice with a strong reference organization and studies the gap. What is it doing?

Solución razonada. Benchmarking. Benchmarking uses comparisons to identify learning opportunities.

3. Caso 3 · Aplicación guiada

A firm hires a provider to operate payroll processing. What remains necessary?

Solución razonada. Oversight of the service, data handling and contractual obligations. Outsourcing changes delivery arrangements, not the need for control.

4. Case 4 · Quality

A factory inspects finished products but repeatedly produces the same defect.

Solución razonada. Investigate causes in the process and support prevention; final inspection alone does not remove the source.

5. Case 5 · Comparison

A small business copies a large company's procedure without considering its resources.

Solución razonada. Adapt the learning to its context and test it. A reference practice is not automatically suitable everywhere.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

The Deming Institute. Principles for management.

4:2.1 Marketing and value for customers

Business foundations · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Defines marketing.

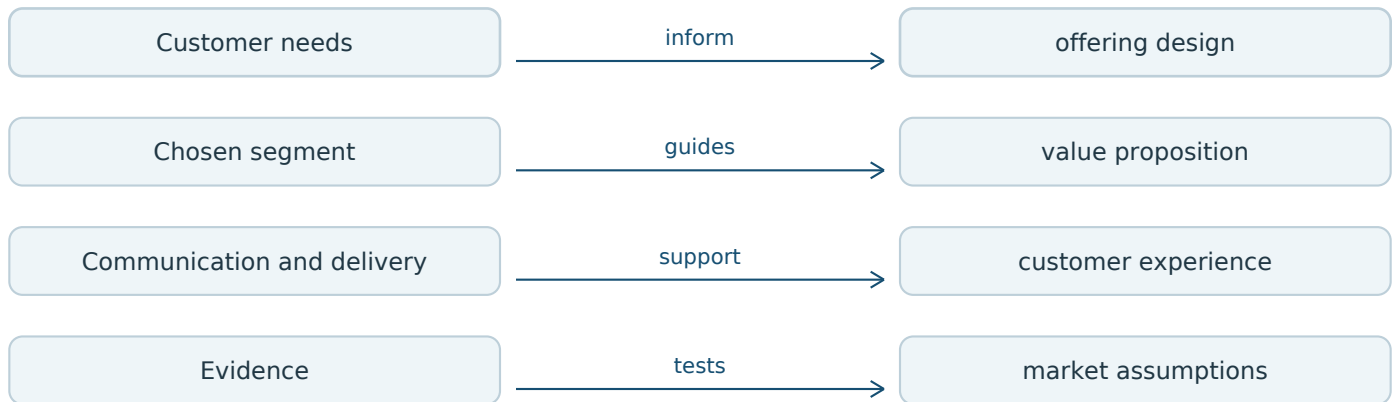

More than selling

Marketing connects understanding a market with designing, communicating and delivering an offering that provides value. Selling is one activity within that broader work. A business studies needs and alternatives, chooses whom to serve and aligns its offering with what those customers value. Advertising cannot repair every mismatch between a product and a real need. Value includes benefits, effort, cost and experience from the customer's perspective; the lowest price is not automatically the best value for every segment.

Evidence and relationships

Research helps reduce uncertainty, but sample quality and the question asked affect conclusions. Customer feedback, observed behavior and repeat use can reveal different aspects of the experience. A marketing decision must also respect truthful communication and appropriate use of personal data. Promising features that the service cannot deliver may raise initial interest while damaging trust. Define what success means before selecting a metric; impressions, inquiries, purchases and retention describe different stages rather than interchangeable outcomes.

Mapa conceptual explicado

Marketing decisions should connect the promise to the experience the customer actually receives.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which statement best describes marketing?

Solución razonada. Understanding markets and creating, communicating and delivering valuable offerings. Marketing includes activities before, during and after a transaction.

2. Caso 2 · Aplicación guiada

A customer pays more for reliable delivery that avoids production delays. What does this illustrate?

Solución razonada. Value can include benefits beyond a low purchase price. The customer evaluates the benefit in the context of their needs.

3. Caso 3 · Aplicación guiada

A company advertises a service before checking whether the target group needs it. What should it investigate?

Solución razonada. The group's needs and evidence of demand. An offering must relate to a relevant market problem or desire.

4. Case 4 · Promise

An advertisement promises immediate support, but the service operates only during office hours.

Solución razonada. Align the promise and actual availability. More promotion does not resolve a misleading commitment.

5. Case 5 · Metric

An advertisement receives many views but few relevant inquiries.

Solución razonada. Views measure exposure; investigate whether the message reaches and interests the intended segment.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

American Marketing Association. Definition of marketing and marketing mix.

4:3.1 The four variables of the marketing mix

Business foundations · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Recognizes variables of mixed market.

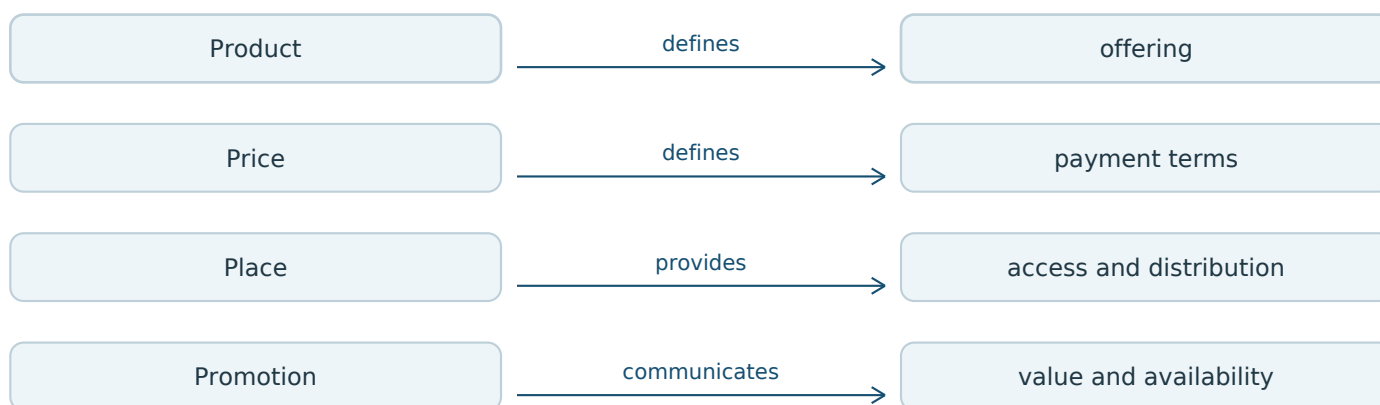

Product, price, place and promotion

The traditional four-P framework organizes decisions about product, price, place and promotion. Product includes the offering's features, quality and supporting service. Price concerns what the customer pays and the related terms. Place concerns availability and distribution channels, not only a building's address. Promotion concerns communication such as advertising, public relations and sales promotion. A discount is a price decision and can also be communicated through a promotion; classification depends on the decision being examined.

Make the decisions work together

The mix should fit the selected segment and value proposition. A premium promise can be undermined by unreliable delivery or an inaccessible support channel. An online channel still requires decisions about ordering, fulfillment, returns and customer assistance. Changing one variable may affect others: a faster delivery service can change costs and price. Use the framework to locate a problem, then check whether the complete combination supports the intended experience. The four Ps are a planning model, not a claim that customers think in four separate boxes.

Mapa conceptual explicado

The variables are distinct for analysis but connected in the customer's experience.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A company adds a repair warranty to its offering. Which P is most directly affected?

Solución razonada. Product. The warranty changes the benefits and support included in the offering.

2. Caso 2 · Aplicación guiada

A business starts selling through an authorized online distributor. Which P describes the channel decision?

Solución razonada. Place. Place concerns how the offering reaches customers.

3. Caso 3 · Aplicación guiada

An advertisement explains a service's benefits to potential customers. Which P is most directly involved?

Solución razonada. Promotion. The decision concerns communication with the market.

4. Case 4 · Terms

A supplier changes from immediate payment to thirty-day credit terms.

Solución razonada. This is part of the price and payment arrangement, even if the listed amount is unchanged.

5. Case 5 · Consistency

A company promises convenience but requires customers to visit a distant office for every return.

Solución razonada. Review the distribution and support arrangements against the promised value.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

American Marketing Association. Definition of marketing and marketing mix.

4:4.1 Professional conduct at a business meal

Business foundations · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Describes the behavior of a professional at the table, as a host, or guest in a restaurant or at home.

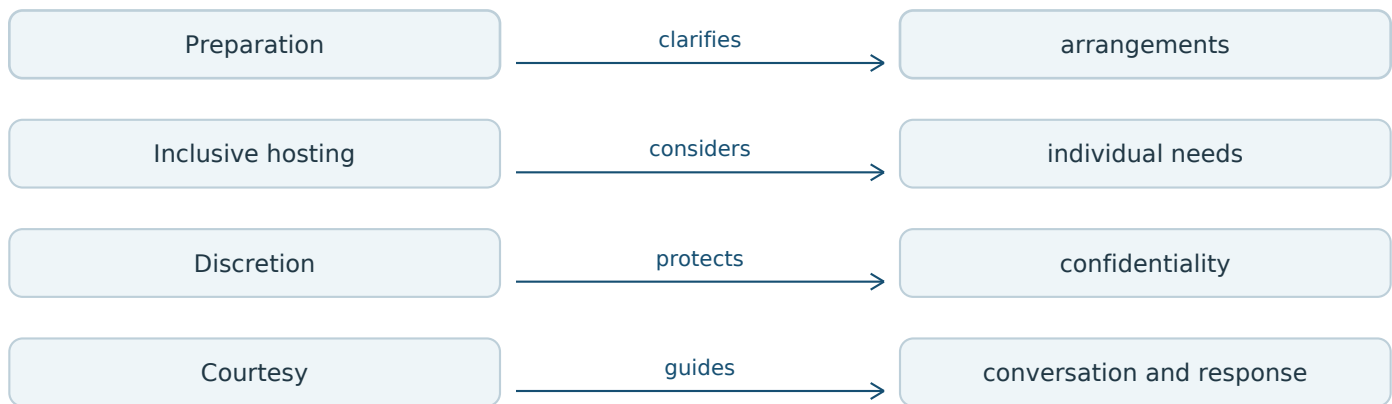

Prepare with consideration

A professional meal combines a social setting with a work relationship. Confirm the time, location and purpose, and clarify relevant arrangements with the organizer. Hosts should consider accessibility and dietary needs discreetly rather than asking guests to explain private matters publicly. Customs differ, so observe the setting, ask politely when uncertain and follow agreed company expectations. Courtesy is not a license to assume that every guest shares the same food, alcohol or cultural preferences.

Respect people and boundaries

Arrive punctually, acknowledge participants and allow balanced conversation. Keep confidential business information out of public discussion, even when the meeting feels informal. Handle phones discreetly and excuse yourself if an urgent interruption is unavoidable. If the host has arranged payment, follow that arrangement without creating a public dispute; if payment is unclear, clarify tactfully. Avoid pressuring anyone to consume food or alcohol. A mistake in service or a small etiquette uncertainty is best handled calmly, with respect for both guests and staff.

Mapa conceptual explicado

Professional behavior centers on respect, clarity and context rather than rigid assumptions about every culture.

Cinco casos para comprender y aplicar

1. Caso 1 • Aplicación guiada

A host needs to know whether guests have dietary requirements. What is the appropriate approach?

Solución razonada. Ask discreetly in advance and coordinate suitable options. Advance, discreet coordination respects privacy and participation.

2. Caso 2 • Aplicación guiada

A guest does not drink alcohol. What should the host do?

Solución razonada. Respect the choice and offer an appropriate alternative. Professional courtesy does not depend on alcohol consumption.

3. Caso 3 • Aplicación guiada

A confidential payroll issue arises in a crowded restaurant. What is the appropriate response?

Solución razonada. Move that discussion to a suitable private setting. A public location can expose sensitive information.

4. Case 4 • Interruption

An urgent call arrives during a meal.

Solución razonada. If it must be answered, excuse yourself briefly and move away rather than placing the call on speaker at the table.

5. Case 5 • Payment

The invitation explicitly states that the company host will pay.

Solución razonada. Follow the arrangement courteously; any administrative clarification can be handled discreetly with the organizer.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

4:5.1 Components of compound interest

Business foundations · rótulo editorial, sin encabezado en la tabla · Décimo

Propósito: Defines compound interest components.

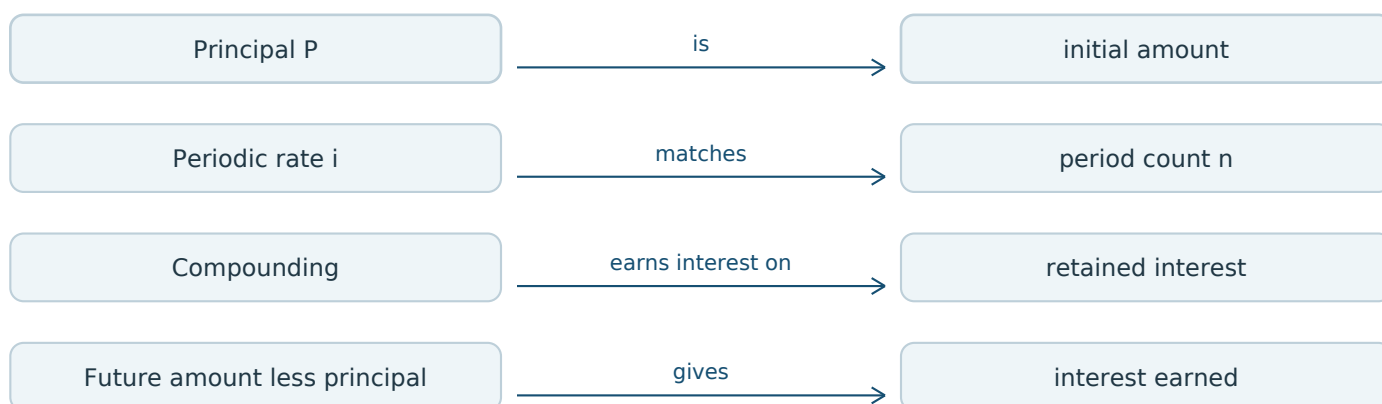

Match the rate and the period

For a single principal with no deposits or withdrawals, compound accumulation is $F = P(1+i)^n$. P is the initial principal, i is the effective rate per compounding period, n is the number of those periods and F is the future amount. Interest earned is $F-P$. The rate and period must agree: a monthly rate requires a count of months. Compounding means that interest retained in the account participates in later interest calculations.

Nominal and effective rates

A nominal annual rate j compounded m times per year gives a periodic rate j/m under that quotation convention. The annual effective rate is $(1+j/m)^m - 1$. An effective annual rate is not automatically divided by twelve to obtain an equivalent monthly effective rate; equivalence requires taking the appropriate root. The formula assumes a specified rate, timing and compounding rule. Fees, taxes, changing rates and additional cash flows require further information. A quoted percentage without its period is insufficient for a sound comparison.

Mapa conceptual explicado

The exponent counts compounding periods, and the rate must describe one of those periods.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

In $F = P(1+i)^n$, what does P represent?

Solución razonada. The initial principal. P is the amount invested or financed at the start.

2. Caso 2 · Aplicación guiada

A nominal annual rate of 12% is compounded monthly. What periodic rate is used under that quotation?

Solución razonada. 1% per month. The nominal rate is divided by twelve compounding periods.

3. Caso 3 · Aplicación guiada

What does compound interest add to later interest calculations?

Solución razonada. Previously earned interest that remains invested. Retained interest becomes part of the balance earning interest.

4. Case 4 • Period count

An investment compounds quarterly for three years.

Solución razonada. There are $3 \times 4 = 12$ quarterly periods. The rate must be the rate for one quarter.

5. Case 5 • Cash flow

An additional deposit occurs halfway through the investment.

Solución razonada. The deposits have different accumulation times. Do not treat all money as if it had been present at the initial date.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

4:5.2 Calculating compound amounts and present values

Business foundations • rótulo editorial, sin encabezado en la tabla • Décimo

Propósito: Calculates compound interest.

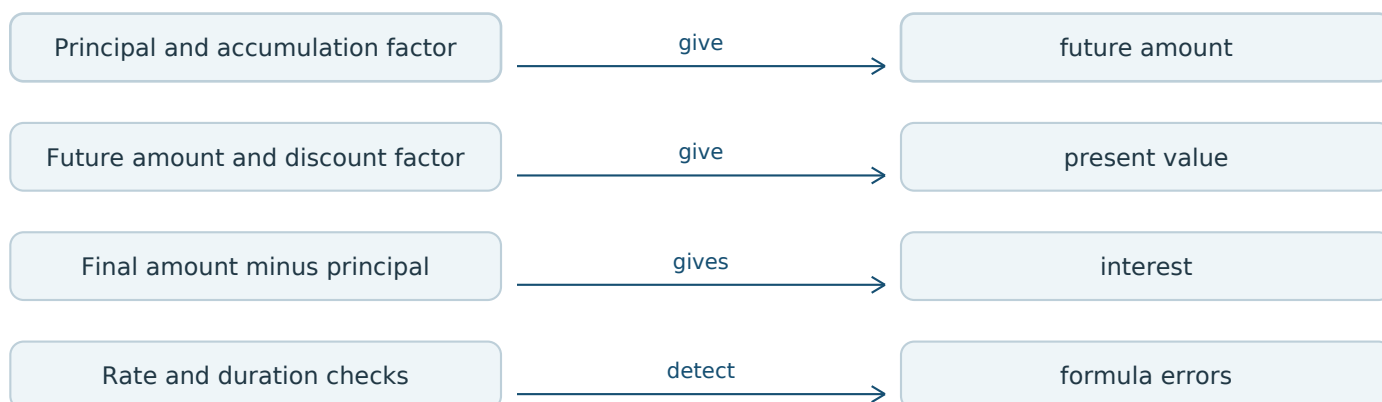

Accumulate a single amount

Start by writing principal, periodic rate and number of periods. Convert the percentage to a decimal and apply $F = P(1+i)^n$. Keep enough precision during intermediate steps and round the final monetary amount as instructed. A simple-interest calculation $P(1+in)$ is not interchangeable with compounding for several periods. When comparing alternatives, use the same principal, duration and cash-flow assumptions; otherwise the difference may reflect more than the interest method.

Work backward and check reasonableness

To find the amount needed today for a known future target, use $P = F/(1+i)^n$ under the same assumptions. Discounting at a positive rate gives a present value below the future amount. Subtract P from F to find interest, not the reverse. With a positive rate and no withdrawals, the accumulated amount should increase with time. These checks help detect a percentage entered as a whole number, a missing exponent or an inconsistent period count. The exercises omit fees and taxes unless stated.

Mapa conceptual explicado

A numerical answer should satisfy both the formula and the direction of the cash-flow story.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Invest 1000 at 10% effective annually for two years, with no other cash flows. What is the future amount?

Solución razonada. 1210. $1000 \times 1.10^2 = 1210$; the second year earns interest on 1100.

2. Caso 2 · Aplicación guiada

A future target is 2420 after two years at 10% effective annually. What principal is needed today?

Solución razonada. 2000. $2420 \div 1.10^2 = 2000$.

3. Caso 3 · Aplicación guiada

An investment of 1000 compounds at 2% per quarter for four quarters. What is the future amount, rounded to cents?

Solución razonada. 1082.43. $1000 \times 1.02^4 = 1082.43216$, rounded to 1082.43.

4. Case 4 · Interest only

A principal of 1200 becomes 1452 after two years at 10% annually.

Solución razonada. Interest earned is $1452 - 1200 = 252$. The future amount includes the principal.

5. Case 5 · Percentage entry

A spreadsheet uses 8 instead of 0.08 as an annual rate.

Solución razonada. The calculation uses 800%, not 8%. Enter a decimal rate or a correctly formatted percentage.

DGEC. Tabla oficial 2026, especialidad 3001, página 6.

5:1.1 Factoring receivables and financing cost

Accounting · Undécimo

Propósito: Calculates factoring in managerial financing means.

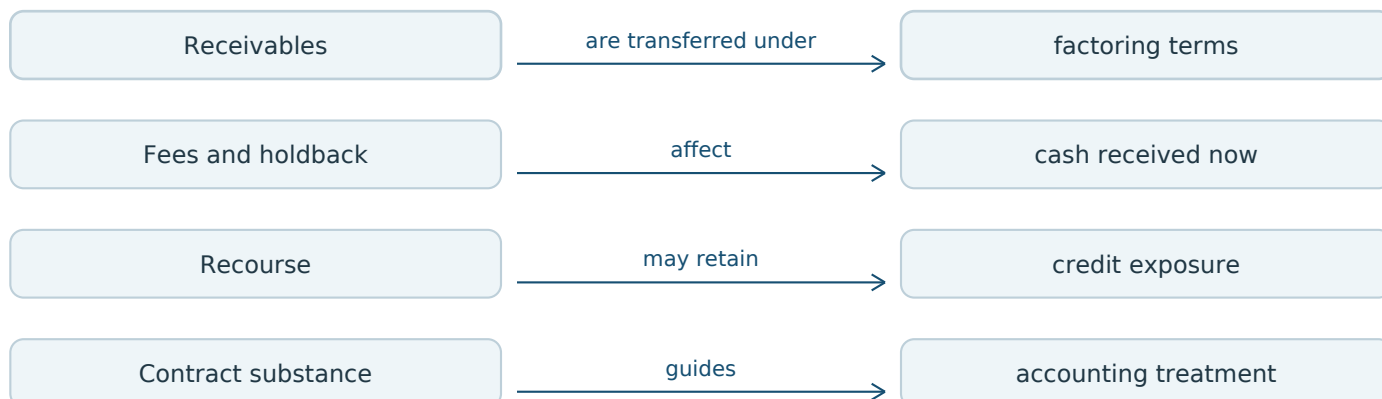

Turn receivables into earlier cash

Factoring involves transferring receivables to a factor under agreed terms, often to obtain cash before customers pay. The contract may specify an advance, a service fee, financing charges, a reserve or holdback, and responsibility if customers fail to pay. Face value is the receivable's stated amount; immediate cash is what the factor actually pays now. A holdback is not automatically a fee: the contract may provide for a later settlement after collections or other conditions.

Read the risk and the calculation

Recourse means the transferor may remain responsible for specified nonpayment; nonrecourse wording must still be read for exclusions and other obligations. Accounting derecognition requires analysis of the applicable financial-instrument rules and the substance of risk and control, not the contract title alone. For a simplified cash calculation, subtract the stated fees and holdback from the face value or advance base identified in the case. Do not charge a percentage to the wrong base. Compare timing, total cost and retained exposure, rather than treating every early payment as a free improvement in liquidity.

Mapa conceptual explicado

Separate the value of the receivable, the financing cost and amounts withheld for later settlement.

Cinco casos para comprender y aplicar

1. Caso 1 • Aplicación guiada

Receivables of 10000 are factored with a fee of 3% of face value. What is the fee?

Solución razonada. 300. $10000 \times 0.03 = 300$.

2. Caso 2 • Aplicación guiada

A factor pays face value 20000 less a fee of 400 and a refundable holdback of 2000. What cash is received immediately?

Solución razonada. 17600. Immediate cash = $20000 - 400 - 2000$; the holdback is not cash received now.

3. Caso 3 • Aplicación guiada

What does factoring with recourse generally require the seller to examine?

Solución razonada. Its continuing responsibility for specified customer nonpayment. Recourse can leave exposure with the transferor under the contract.

4. Case 4 • Holdback

A factor withholds 1000 pending collections and separately charges a nonrefundable fee of 200.

Solución razonada. Do not combine both amounts as a 1200 fee without examining the right to the holdback and its settlement conditions.

5. Case 5 • Accounting

A contract is titled sale of receivables but leaves substantial risks with the seller.

Solución razonada. Assess the applicable derecognition requirements and substance before removing the receivable; the title alone is insufficient.

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IFRS 9 Financial Instruments.

5:2.1 Accounts payable and supplier obligations

Accounting · Undécimo

Propósito: Lists the concept and importance of accounts payable.

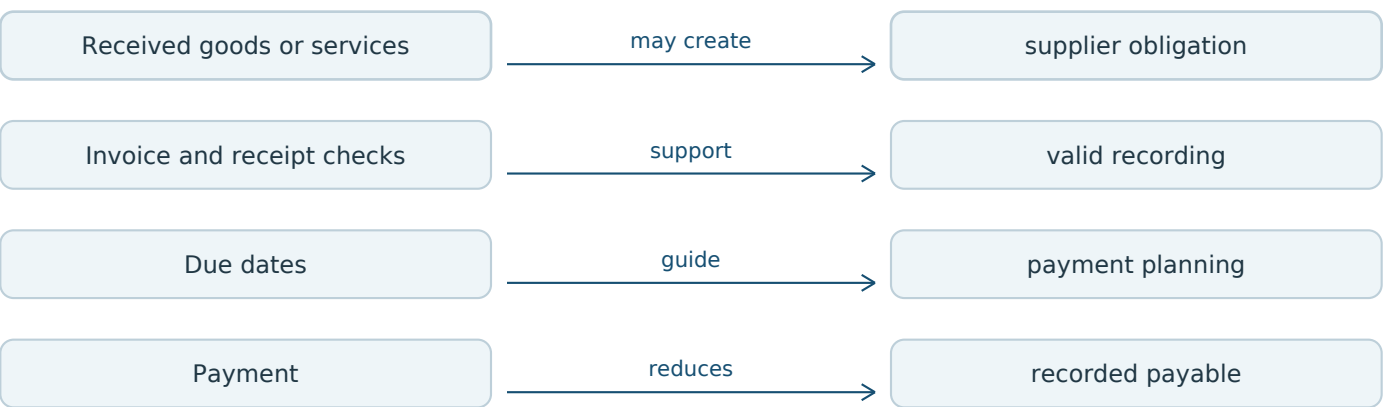

Recognize an obligation

Accounts payable normally record amounts owed to suppliers for goods or services already received on credit. They support the link between receipt, expense or asset recognition, and later payment. A purchase order alone does not always establish that the goods or services have been received or that a payable should be recorded. Check the transaction’s substance, delivery conditions and applicable accounting requirements. A supplier balance is not revenue just because payment has been postponed.

Control the payment cycle

Compare purchase authorization, receipt evidence and invoice details before payment. Reconcile supplier statements with the ledger and investigate unmatched items, duplicate invoices, credit notes and payments in transit. An aging schedule groups obligations by due status and helps plan liquidity. Taking credit from suppliers can support operations, but overdue balances may harm relationships or create charges. Separate recording, approval and payment where practical; verify changes to bank details independently through a trusted channel. Paying a recorded liability reduces the payable rather than recognizing the original purchase a second time.

Mapa conceptual explicado

The payable tracks what is owed; control checks whether the obligation and its settlement are valid.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

What does a trade account payable normally represent?

Solución razonada. An obligation to a supplier for goods or services received on credit. Payables and receivables represent opposite sides of the credit relationship.

2. Caso 2 · Aplicación guiada

Why is a supplier aging schedule useful?

Solución razonada. It shows when obligations are due or overdue. Due information supports planning but does not replace validity checks.

3. Caso 3 · Aplicación guiada

What should happen when an already recorded supplier balance is paid?

Solución razonada. Reduce the payable and the cash balance. Settlement cancels the obligation without duplicating the original transaction.

4. Case 4 · Credit note

A supplier issues a valid credit note for returned goods.

Solución razonada. Match it to the transaction and adjust the supplier balance and related account appropriately; do not leave a known overstatement.

5. Case 5 · Bank details

An email claims that the supplier has changed bank accounts.

Solución razonada. Verify through a previously trusted contact method before updating payment instructions.

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

5:2.2 Foreign-currency payables and exchange differences

Accounting · Undécimo

Propósito: Solves payable accounts transactions in foreign currencies and operations shown in financial statements with corresponding footnotes.

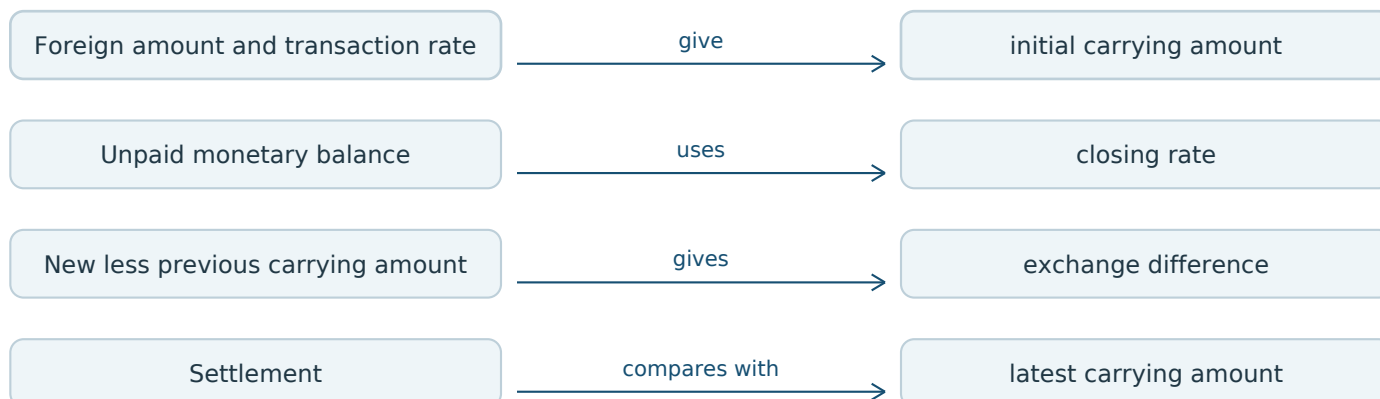

Identify the functional currency

A foreign-currency payable must be measured in the entity's functional currency using the applicable exchange-rate rules. For these introductory cases, a normal monetary payable is initially translated at the transaction-date spot rate and retranslated at the closing rate while unpaid. A higher functional-currency cost of settling the same foreign amount increases the liability; a lower cost reduces it. The cases exclude hedges, foreign-operation translation and exceptional exchangeability issues.

Separate remeasurement and settlement

The foreign-currency amount may remain unchanged while its carrying amount changes. Compare the new translated amount with the previous carrying amount to determine the period's exchange difference. When payment occurs after a reporting date, compare settlement cash with the last remeasured balance, not again with the original amount, or a prior difference will be counted twice. Notes should explain material policies, currency exposure and relevant terms under the applicable disclosure requirements. Exchange rates in these exercises are given assumptions, not live market quotations.

Mapa conceptual explicado

An unchanged dollar debt can change in colones; recognize each period's difference only once.

Cinco casos para comprender y aplicar

1. Caso 1 • Aplicación guiada

Functional currency is CRC. A payable of USD 2000 is first recognized at CRC 500 per USD. What is its initial amount?

Solución razonada. CRC 1000000. $2000 \times 500 = 1000000$ CRC.

2. Caso 2 • Aplicación guiada

A USD 2000 payable has a carrying amount of CRC 1000000. At closing, the rate is CRC 520 per USD. What difference arises in this ordinary case?

Solución razonada. An exchange loss of CRC 40000. The liability increases to 1040000; the increase is a loss.

3. Caso 3 • Aplicación guiada

A USD 1000 payable is carried at CRC 530000 and is settled at CRC 510 per USD. What difference arises on settlement?

Solución razonada. An exchange gain of CRC 20000. Cash paid is 510000, below the liability of 530000 by 20000.

4. Case 4 • Two dates

A payable starts at 500000, is remeasured to 520000 at year-end and later settled for 525000.

Solución razonada. The first period recognizes a 20000 loss; settlement later adds a 5000 loss. The original 20000 is not recorded again.

5. Case 5 • Notes

A material payable is denominated in a foreign currency with significant exchange exposure.

Solución razonada. Present the amount correctly and assess the required disclosures about currency, terms and risk; a converted total may not tell the whole story.

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 21 The Effects of Changes in Foreign Exchange Rates.

5:3.1 Inventory according to business activity

Accounting • Undécimo

Propósito: Mentions about inventories according to company's nature (activity).

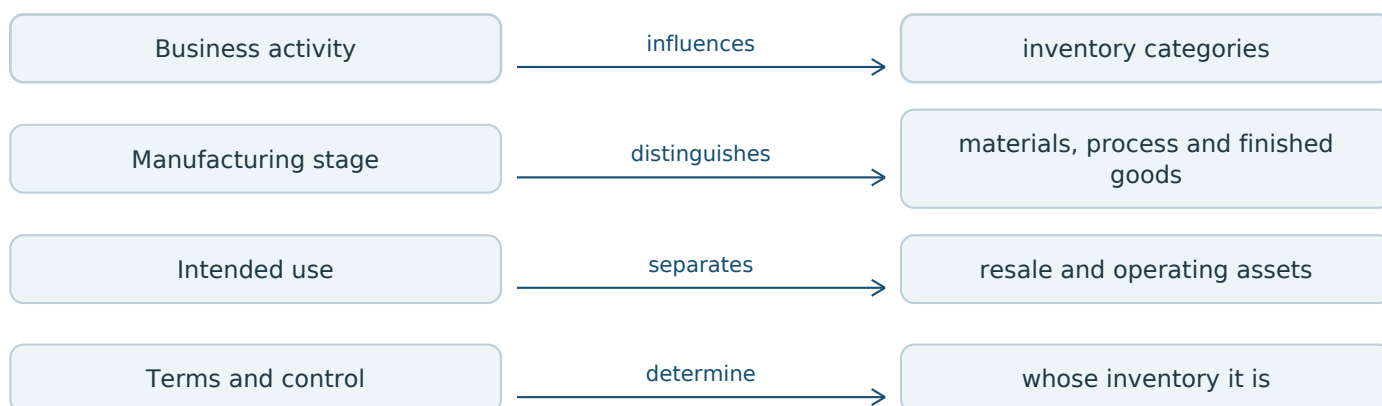

What the entity holds and why

Inventory classification follows the entity's activity and the purpose for which an item is held. A retailer generally holds merchandise for resale. A manufacturer distinguishes raw materials, work in process and finished goods. An item being manufactured is not finished goods merely because its materials are complete; conversion may still be pending. A service business may hold supplies or goods for sale, so providing services does not automatically mean it has no inventory.

The same object can have another role

A vehicle held for resale by a dealer can be inventory, while a vehicle used to deliver that dealer's goods may be property, plant and equipment. Goods stored on the premises are not automatically owned by the entity: consignment and delivery terms matter. Physical location, ownership or control conditions, and intended use must be considered together. Inventory records help track quantities and cost, while counts and document checks test whether those records represent actual holdings. Classifying by the object's name alone can misstate both assets and expenses.

Mapa conceptual explicado

Ask what the item is for and what stage it has reached, not only where it is stored.

Cinco casos para comprender y aplicar

1. Caso 1 • Aplicación guiada

A clothing retailer buys shirts to sell without manufacturing them. What are those shirts?

Solución razonada. Merchandise inventory. They are goods held for resale.

2. Caso 2 · Aplicación guiada

A manufacturer has partly assembled products that still require processing. How are they classified?

Solución razonada. Work in process. Production has begun but the goods are not yet complete.

3. Caso 3 · Aplicación guiada

A dealership uses one vehicle for its own deliveries instead of holding it for sale. What determines its different classification?

Solución razonada. Its use in operations rather than resale. Classification depends on the purpose and applicable recognition rules.

4. Case 4 · Supplies

A consulting firm keeps consumable office supplies for future use.

Solución razonada. A service activity can have supplies; examine their nature and materiality rather than assuming all purchases are immediately consumed.

5. Case 5 · Consignment

Goods belonging to another entity are stored for sale on its behalf.

Solución razonada. Check the consignment terms before including them as the holder's own inventory.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 2 Inventories.

5:3.2 Why inventory requires adjusting entries

Accounting · Undécimo

Propósito: Determines reasons for adjusting entries.

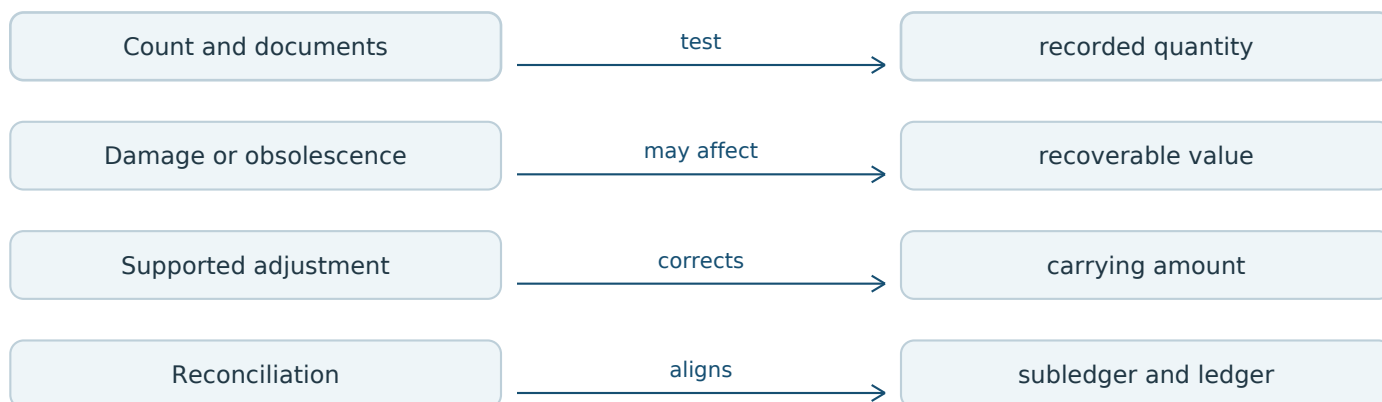

Records and reality can diverge

Inventory adjustments may arise from count differences, damage, obsolescence, cutoff errors or changes in recoverable value. First establish reliable evidence: recount when appropriate, inspect documents and identify whether goods belong to the entity. A count difference should not be explained automatically as theft; timing, recording and measurement errors can also cause it. Determine the cause and required accounting treatment before changing the ledger.

Quantity and value are different checks

An accurate quantity does not guarantee an accurate carrying amount. Under the inventory model studied, compare cost with net realizable value, which reflects estimated selling proceeds less completion and selling costs. A write-down can be necessary even when every unit is physically present. Conversely, finding fewer units is a quantity discrepancy that requires investigation and supported adjustment. After an entry, reconcile the subsidiary inventory records and general ledger so one does not retain the old balance. Do not use arbitrary adjustments to force a target profit.

Mapa conceptual explicado

An adjustment responds to evidence about quantity, ownership, timing or value.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

The ledger shows 100 units at 8 each; a verified shortage of 5 units requires adjustment under the case. What amount is removed from inventory?

Solución razonada. $40. 5 \times 8 = 40$; the remaining 95 units have cost 760 before other adjustments.

2. Caso 2 · Aplicación guiada

All units are present, but their cost exceeds net realizable value. Can an adjustment still be needed?

Solución razonada. Yes, physical accuracy does not ensure recoverable value. Quantity and measurement are separate aspects of inventory.

3. Caso 3 · Aplicación guiada

A count differs from the ledger. What should be done before assuming a cause?

Solución razonada. Investigate counts, documents, cutoff and relevant conditions. Several causes can explain the difference.

4. Case 4 · Cutoff

Goods are recorded twice because receipt and invoice were entered in different systems.

Solución razonada. Trace both records to the same transaction and correct the duplicate with an audit trail.

5. Case 5 · Obsolescence

A model remains in stock after demand falls sharply.

Solución razonada. Review evidence of expected recovery and the need for a write-down; unchanged quantity does not settle the valuation question.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 2 Inventories.

5:4.1 The role of property, plant and equipment

Accounting · Undécimo

Propósito: Recognizes importance of property term, place and equipment.

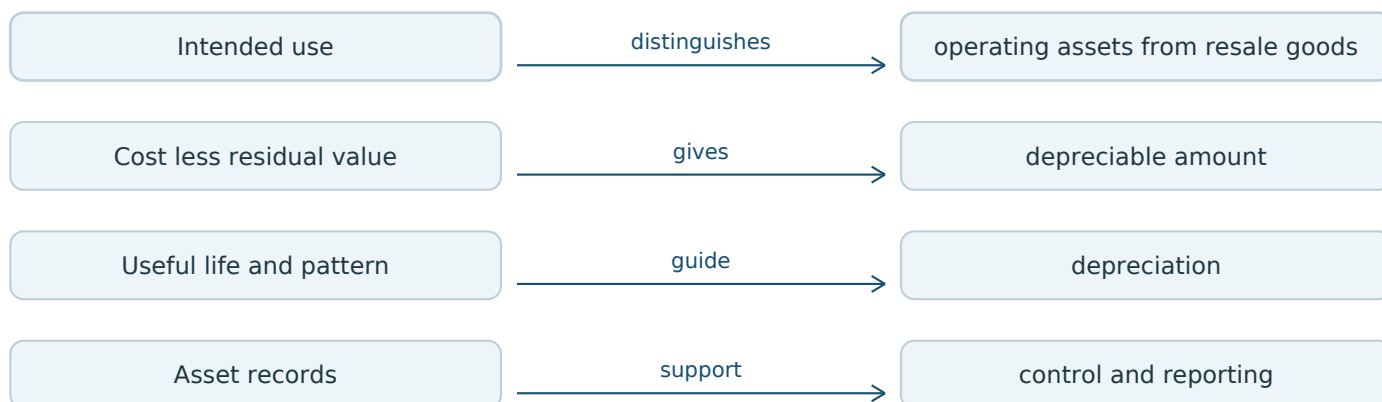

Assets used over time

Property, plant and equipment are tangible items used in production, supply, administration or rental over more than one period under the relevant recognition criteria. The official table uses the wording property, place and equipment; the standard English term is property, plant and equipment. A machine held for resale is distinguished from a machine used to manufacture products. Tangibility alone does not determine classification; intended use and the applicable standard matter.

Service potential and consumption

Capitalizing an item recognizes an asset rather than immediately treating its whole cost as a period expense. Depreciation allocates the depreciable amount over useful life using an appropriate pattern; it does not create a cash fund or guarantee market value. Depreciable amount is cost less residual value under the simple cost model used here. Land and buildings are considered separately; land normally has an unlimited useful life, while buildings usually have a limited life. Records should identify location, custodian, cost, useful life and accumulated depreciation, with impairment considered when relevant.

Mapa conceptual explicado

The asset supports several periods; depreciation represents consumption rather than cash saved for replacement.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which item is normally property, plant and equipment for a bakery?

Solución razonada. An oven used to bake products for several years. The oven is a tangible operating asset used over several periods.

2. Caso 2 · Aplicación guiada

What is the main purpose of depreciation?

Solución razonada. Allocate the depreciable amount over useful life using an appropriate pattern. Depreciation is an allocation process, not a cash transfer or market appraisal.

3. Caso 3 · Aplicación guiada

An asset costs 10000 and has estimated residual value 1000. What is its depreciable amount?

Solución razonada. 9000. Depreciable amount = cost–residual value = 9000.

4. Case 4 · Same object

A computer retailer keeps one computer for sale and uses another for bookkeeping.

Solución razonada. The first may be inventory; the second may be equipment. Their purpose in the business determines classification.

5. Case 5 · Land and building

A purchase includes a building and the land beneath it.

Solución razonada. Separate their accounting assessment rather than depreciating an undifferentiated total under one assumed life.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 16 Property, Plant and Equipment.

5:4.2 Measuring, depreciating and disposing of equipment

Accounting · Undécimo

Propósito: Answers cases of property, place and equipment and its presentation in the general balance.

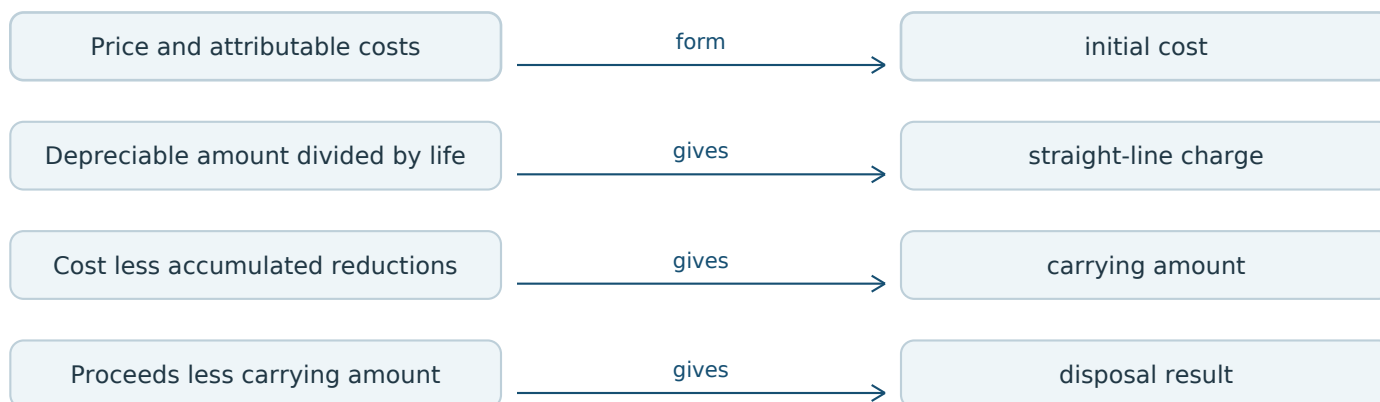

Build the initial cost

For the simplified IAS 16 cases, initial cost includes purchase price after trade discounts and costs directly attributable to bringing the asset to the location and condition needed for its intended operation. Recoverable taxes are separated; training and general start-up advertising are not added merely because they accompany the purchase. Identify the nature of each cost instead of capitalizing the invoice total automatically. Depreciation begins when the asset is available for use under the applicable rules, not only when the first profitable sale occurs.

Follow the carrying amount

Under straight-line depreciation, annual expense equals cost less residual value divided by useful life. The case must specify time available for use and any partial-year convention. Carrying amount is cost minus accumulated depreciation and relevant impairment under the cost model. On disposal, compare proceeds with carrying amount to find the gain or loss and remove both cost and accumulated depreciation. A change in estimated useful life is assessed as an estimate change under the applicable framework; do not silently rewrite earlier records to reach a preferred result.

Mapa conceptual explicado

Initial recognition, use and disposal are linked stages with different calculations.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A machine costs 20000; necessary transport is 1000 and installation 2000. Training costs 500. No taxes apply. What initial machine cost is used in the case?

Solución razonada. 23000. Purchase, transport and installation total 23000; training is not included in this asset cost.

2. Caso 2 · Aplicación guiada

Equipment costs 12000, residual value is 2000 and useful life is five years. What is annual straight-line depreciation for a full year?

Solución razonada. 2000. $(12000 - 2000) \div 5 = 2000$.

3. Caso 3 · Aplicación guiada

Equipment cost is 9000 and accumulated depreciation is 3500, with no impairment. What is the carrying amount?

Solución razonada. 5500. $9000 - 3500 = 5500$.

4. Case 4 · Sale

Equipment has cost 6000, accumulated depreciation 4500 and sale proceeds 1800, with no other adjustments.

Solución razonada. Carrying amount is 1500; gain is $1800 - 1500 = 300$. Remove the original asset and accumulated depreciation.

5. Case 5 · Ready for use

A machine is installed and available for its intended use but is temporarily idle.

Solución razonada. Do not assume the depreciation start date is postponed until the first customer order; review availability-for-use requirements.

IFRS Foundation. IAS 16 Property, Plant and Equipment.

5:5.1 Accounts within equity

Accounting · Undécimo

Propósito: Names accounts that make the patrimony.

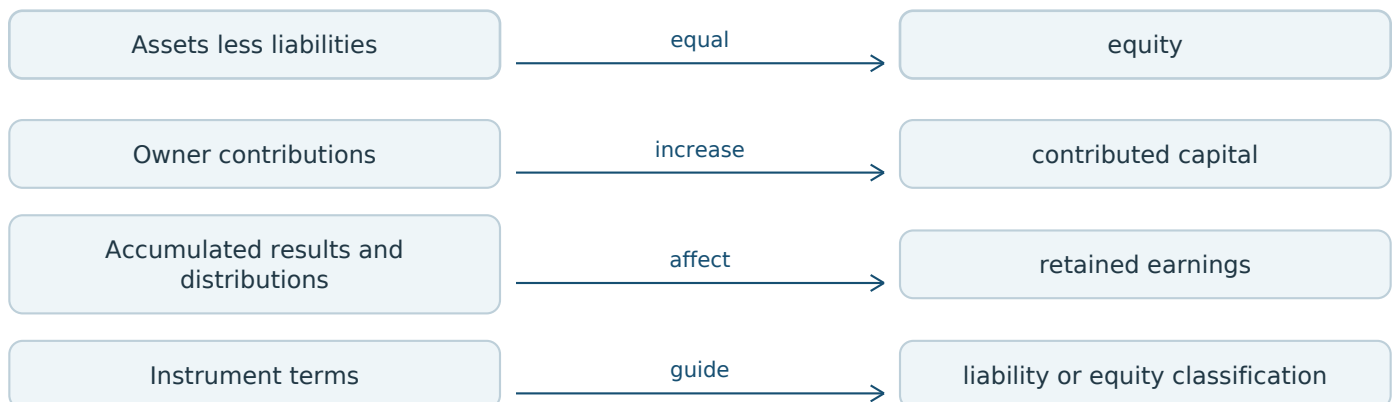

Residual interest and its components

Equity is the residual interest after deducting liabilities from assets. Common components include contributed capital, retained earnings and relevant reserves or other accumulated equity amounts under the entity's framework. Contributions from owners are not revenue from customers. Retained earnings accumulate results and distributions over time; they are not automatically a separate bank account. A reserve may reflect a legal or organizational allocation within equity, but its title alone does not establish a new asset.

Distinguish owners and creditors

An obligation to repay a lender remains a liability even when the lender is an owner. Conversely, a genuine equity contribution increases equity rather than sales. The terms of an instrument matter: calling it a share does not settle classification when there is a contractual obligation to deliver cash. Not every equity movement passes through profit or loss. Read the statements and notes together to understand capital changes, distributions and accumulated amounts. The introductory exercises specify ordinary equity arrangements and exclude complex instruments unless stated.

Mapa conceptual explicado

The source and conditions of funds determine the account, not merely who supplied them.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which account normally forms part of equity?

Solución razonada. Retained earnings. Retained earnings accumulate undistributed results and related changes.

2. Caso 2 · Aplicación guiada

An owner makes an ordinary permanent capital contribution. How is it distinguished from a sale?

Solución razonada. It increases contributed equity rather than customer revenue. The owner acts as owner, not as a customer buying the entity's output.

3. Caso 3 • Aplicación guiada

Does a retained earnings balance necessarily mean the same amount is held in cash?

Solución razonada. No; those resources may be invested in different assets. Equity describes financing and residual interest, not a particular asset location.

4. Case 4 • Owner loan

An owner lends money under an enforceable repayment agreement.

Solución razonada. Analyze it as a liability under the stated terms; the lender's ownership does not automatically make the amount capital.

5. Case 5 • Reserve

The entity transfers an amount from retained earnings to an equity reserve.

Solución razonada. Under that stated classification, total equity is unchanged; the allocation does not itself create additional cash.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 32 Financial Instruments: Presentation.

5:5.2 Classifying and reconciling equity changes

Accounting • Undécimo

Propósito: Classifies patrimony accounts.

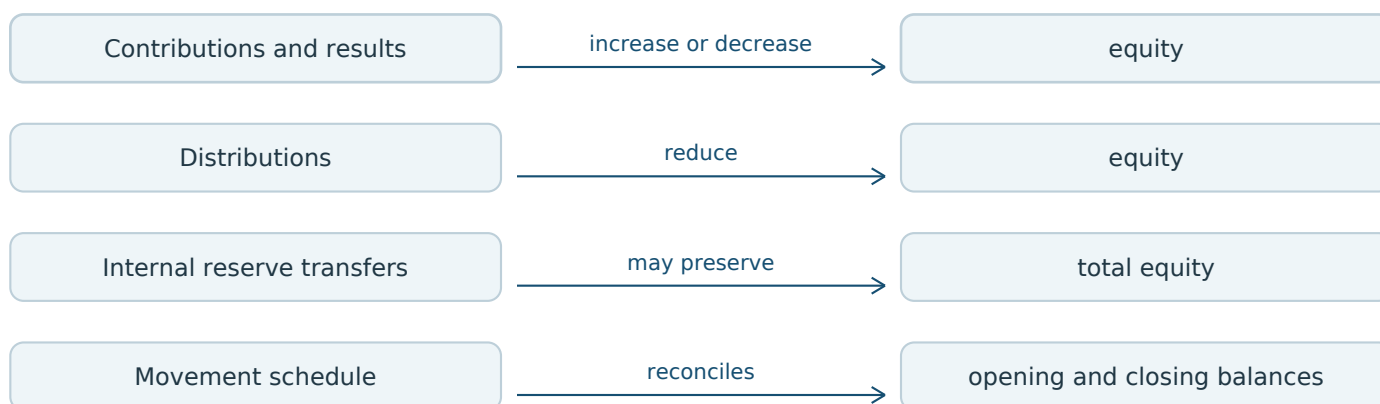

Separate kinds of movement

A statement or schedule of equity changes distinguishes owner contributions, profit or loss, distributions and other relevant changes. An ordinary dividend distribution reduces equity; it is not an operating expense for earning revenue. A transfer between equity reserves can change their presentation without changing total equity. Treasury shares, where the applicable rules require a deduction from equity, should not be treated as an ordinary investment asset in the entity's own shares.

Reconcile beginning and ending balances

For the simple cases here, ending equity = beginning equity + contributions + profit – distributions, with any other stated changes included separately. This equation can be rearranged to find a missing component, but do not assume that every unexplained difference is profit: omitted contributions or distributions may also explain it. Classify each movement first and then calculate. Use supporting approvals and records to distinguish a declared distribution payable from an informal proposal, and disclose material changes under the applicable framework.

Mapa conceptual explicado

Reconciliation is useful only when each movement is classified according to its substance.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Beginning equity is 500, contributions 100, profit 80 and distributions 30, with no other changes. What is ending equity?

Solución razonada. 650. $500 + 100 + 80 - 30 = 650$.

2. Caso 2 · Aplicación guiada

A transfer of 40 moves retained earnings into an equity reserve, with no other effect. How does total equity change?

Solución razonada. It does not change. The transfer reallocates amounts within equity.

3. Caso 3 · Aplicación guiada

How is an ordinary dividend distribution distinguished from an operating expense?

Solución razonada. It is a distribution to owners that reduces equity. Owners receive a distribution in their ownership capacity.

4. Case 4 · Missing profit

Equity changes from 300 to 390; contributions are 50 and distributions 20, with no other changes.

Solución razonada. Profit = $390 - 300 - 50 + 20 = 60$. Check the other movements before solving.

5. Case 5 · Own shares

A transaction involves repurchasing the company's own ordinary equity instruments under the standard treatment.

Solución razonada. Assess the deduction within equity; do not treat own ordinary shares like an external investment without applying the relevant rules.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 7.

IFRS Foundation. IAS 32 Financial Instruments: Presentation.

5:6.1 Savings and loan associations

Accounting · Duodécimo

Propósito: Mentions aspects about the savings and loan associations.

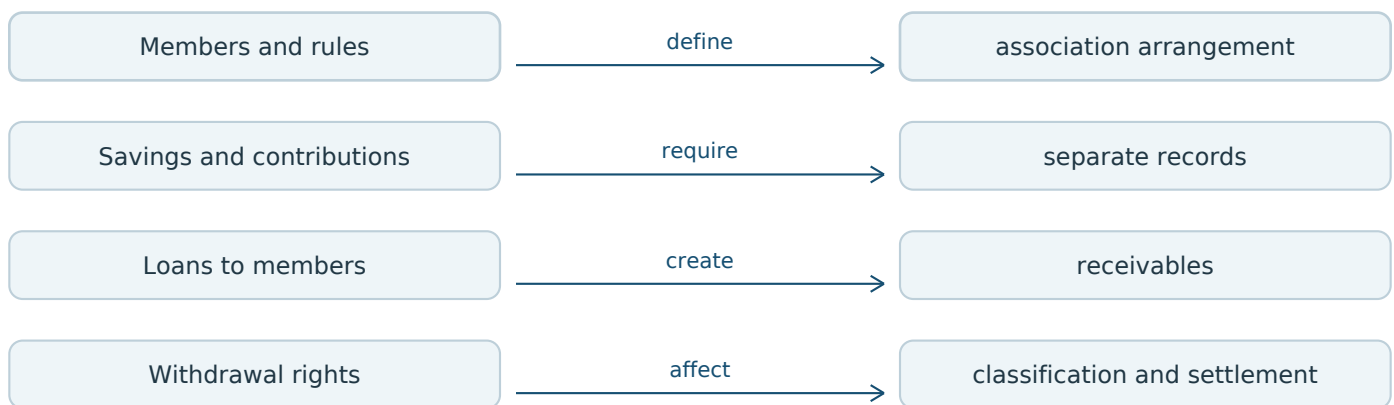

Understand the arrangement

A savings and loan association pools or administers members' funds and provides services such as savings and credit under its governing rules. In the Costa Rican curricular context, examine the specific association, law and bylaws rather than assuming that every organization has the same membership, contribution rate or withdrawal right. Member savings, employer-related contributions, reserves, loans and distributable surpluses must be distinguished. A loan granted to a member is an asset to the association and an obligation to the borrower.

Rights determine accounting

Classify contributions and savings by their legal and contractual terms. Some balances may be repayable obligations; calling all member funds equity without analysis can be wrong. Maintain individual member records, reconcile collections and authorize loans and withdrawals. A contribution collected through payroll must be traced from deduction to transfer and member account. Surplus allocation follows valid rules and approvals; distribution is not simply whatever cash remains in the bank. Before a withdrawal, determine balances, outstanding loans, restrictions and the treatment of each fund under the applicable regime.

Mapa conceptual explicado

The association's name does not replace analysis of each fund's rights, obligations and records.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

An association lends 1000 to a member. What does the association normally recognize for the principal?

Solución razonada. A loan receivable. The association has a claim for repayment rather than income from the principal itself.

2. Caso 2 · Aplicación guiada

A member's stated monthly saving is 4% of a salary of 600000. What amount is saved under the case?

Solución razonada. $24000. 600000 \times 0.04 = 24000$; the percentage is supplied for the exercise.

3. Caso 3 · Aplicación guiada

Why should member savings and other contribution funds be recorded separately?

Solución razonada. Their ownership, withdrawal rights and treatment may differ. Different rights require appropriate classification and settlement.

4. Case 4 · Reconciliation

Payroll shows a deduction, but the member's association statement does not show receipt.

Solución razonada. Trace the deduction, transfer and posting before changing a balance. The three steps need evidence.

5. Case 5 · Withdrawal

A departing member has savings and a loan outstanding.

Solución razonada. Apply the relevant terms to each balance and any permitted settlement. Do not assume all funds can be withdrawn without checking obligations.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

IFRS Foundation. IAS 32 Financial Instruments: Presentation.

5:7.1 Working capital and cash-flow information

Accounting · Duodécimo

Propósito: Names objectives of the working capital analysis and statement of change in the financial position based on cash.

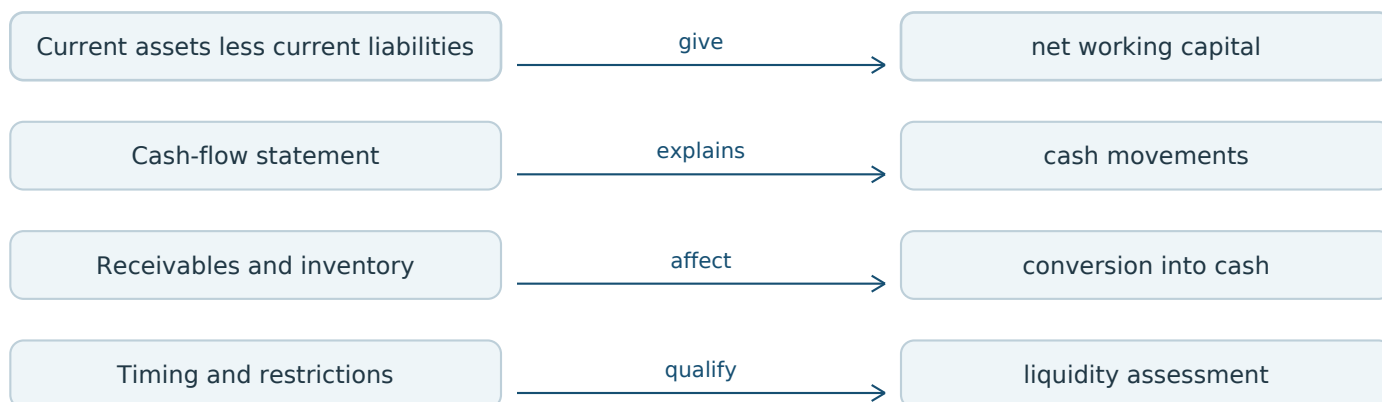

Different questions about liquidity

Net working capital is current assets minus current liabilities under the definition used here. It gives a balance-sheet view of short-term resources relative to short-term obligations. It is not the same as cash: current assets may include receivables and inventory that are not immediately available for payment. A cash-flow statement explains changes in cash and cash equivalents during a period and helps users understand how operations, investment and financing affect liquidity.

Read position and movement together

Profit can be positive while cash falls, for example when credit sales remain uncollected or inventory purchases absorb funds. A positive working-capital balance does not prove every bill can be paid on its due date. Examine timing, recoverability and restrictions as well as totals. Cash equivalents require high liquidity and insignificant risk of value change under the applicable definition; not every short-term investment qualifies merely because it can be sold. Use the statements together with notes and schedules to distinguish an operating cash shortage from an intentional investment financed by a loan.

Mapa conceptual explicado

One measure describes a position; the other explains movements. Neither replaces the details behind it.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Current assets are 900 and current liabilities 540. What is net working capital?

Solución razonada. $360. 900 - 540 = 360$. The amount is different from the current ratio.

2. Caso 2 · Aplicación guiada

What is a main purpose of the statement of cash flows?

Solución razonada. Explain changes in cash and cash equivalents during the period. It organizes cash movements and their sources and uses.

3. Caso 3 · Aplicación guiada

Why can positive profit coexist with low cash?

Solución razonada. Some recognized revenue may still be uncollected. Accrual recognition and collection can occur in different periods.

4. Case 4 · Inventory

A business has positive working capital mainly in slow-moving inventory.

Solución razonada. Review how and when the inventory can turn into cash; the total alone does not establish immediate payment capacity.

5. Case 5 · Restricted balance

A bank balance is restricted for a specific obligation.

Solución razonada. Identify the restriction when assessing cash available for other payments instead of treating all balances as freely usable.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

IFRS Foundation. IAS 7 Statement of Cash Flows.

5:7.2 Controls over working capital

Accounting · Duodécimo

Propósito: Enumerates the financial control of the working capital.

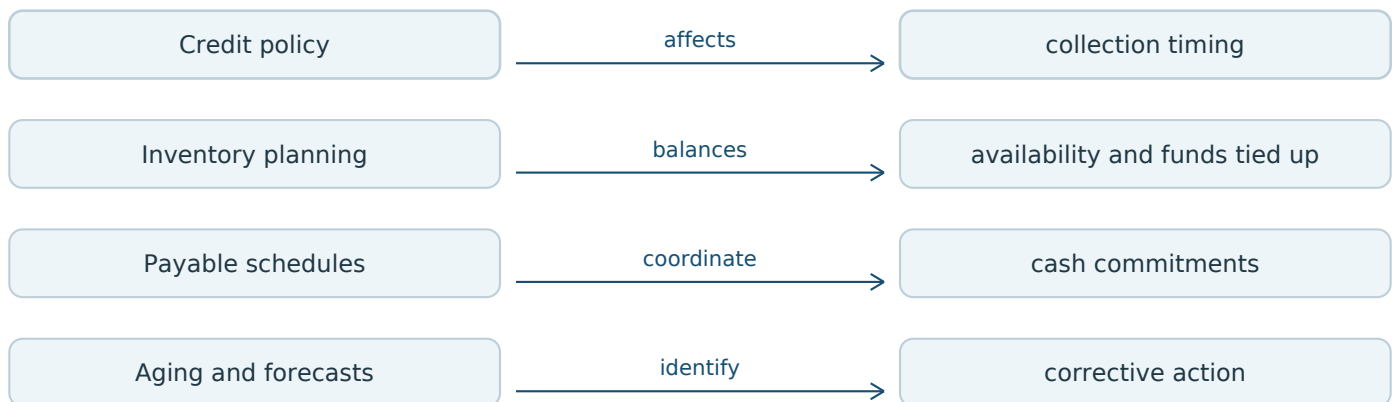

Control the operating cycle

Working capital management coordinates customer collection, inventory availability and supplier payment. Credit sales support demand but can delay cash; large stocks may protect supply while tying up funds. Supplier terms provide financing but must be respected. Define credit approval, collection follow-up, inventory reorder rules and payment schedules. The objective is not to maximize every balance independently; the balances interact through the operating cycle.

Monitor and act on evidence

Use receivable aging, stock movement reports, cash forecasts and reconciliations to find emerging problems. An overdue receivable may require collection action and a review of recoverability rather than continued treatment as readily available cash. Inventory records should distinguish usable stock from obsolete or committed goods. Verify payment instructions and separate key duties where possible. A forecast is updated when assumptions change; keeping an old forecast simply because it balances does not control liquidity. Measures should support legitimate business needs without hiding overdue obligations or manipulating reporting dates.

Mapa conceptual explicado

Controls turn a working-capital total into specific actions about customers, stock and payments.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which report helps identify overdue customer balances?

Solución razonada. An accounts receivable aging schedule. Aging groups receivables by time outstanding or due status.

2. Caso 2 · Aplicación guiada

Why should obsolete stock be separated from usable stock in liquidity analysis?

Solución razonada. It may not convert into expected cash through normal sales. Recorded quantity can overstate practical availability or recovery.

3. Caso 3 · Aplicación guiada

A major customer delays payment beyond the forecast date. What should treasury do?

Solución razonada. Update the cash forecast and assess the resulting payment gap. A changed inflow assumption can affect the ability to meet commitments.

4. Case 4 · Collection

The sales team wants to extend credit without checking overdue balances.

Solución razonada. Coordinate the credit decision with collection evidence and approved limits; additional sales can increase exposure.

5. Case 5 · Reorder

The same inventory target is used for every product despite different lead times and demand.

Solución razonada. Review item-specific needs and uncertainty instead of treating all stock as interchangeable.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

5:8.1 Cash-based and working-capital-based funds statements

Accounting · Duodécimo

Propósito: Lists objectives and importance of both statements for the companies.

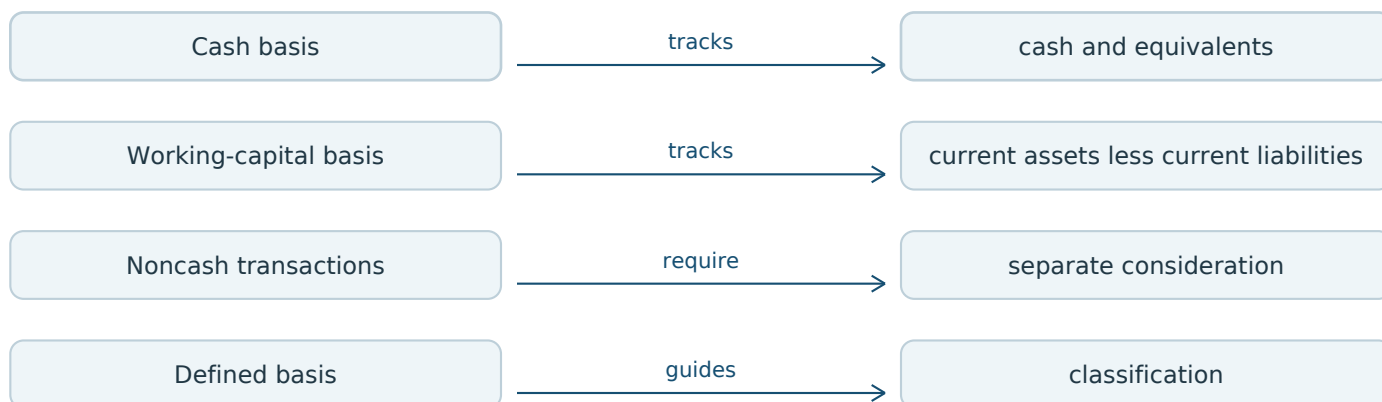

Define what funds means

A statement of cash flows explains movements in cash and cash equivalents. A traditional statement of changes in financial position based on working capital instead analyzes sources and uses affecting net working capital. The curricular table asks students to understand both bases. They must not be presented as interchangeable: a transaction can change cash without changing net working capital. Always state which definition is being used before classifying a movement.

Historical analysis and current reporting

The working-capital-based funds statement is studied as an analytical and historical framework; it does not replace the cash-flow statement required under IAS 7 when that standard applies. Cash flows are grouped into operating, investing and financing categories. Noncash investing and financing transactions are excluded from the cash-flow totals and disclosed as required. A working-capital schedule examines movements between current and noncurrent categories under its stated conventions. These tools help explain financing decisions and resource use, but neither by itself measures all profitability or all business risk.

Mapa conceptual explicado

State the fund definition first; the same transaction can have a different effect under each basis.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A company pays a current payable of 100 using cash. What happens to net working capital, with no other effects?

Solución razonada. It stays unchanged because current assets and current liabilities both fall by 100. The difference between the two current totals is unchanged.

2. Caso 2 · Aplicación guiada

Which statement distinguishes the two analytical bases?

Solución razonada. Cash and net working capital are different measures of funds. Net working capital includes noncash current assets and current liabilities.

3. Caso 3 · Aplicación guiada

Equipment is acquired entirely by issuing a long-term note, with no cash paid. How is it treated in cash-flow totals?

Solución razonada. It is excluded from cash-flow totals and considered for separate noncash disclosure. The transaction affects assets and liabilities but has no current cash flow.

4. Case 4 · Loan

A long-term loan produces cash of 500.

Solución razonada. Cash and net working capital both increase by 500 under the stated classification; financing explains the source.

5. Case 5 · Historical tool

A report of sources and uses of working capital is available.

Solución razonada. It can support analysis, but it is not automatically an IAS 7 statement of cash flows; prepare the required basis separately.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

IFRS Foundation. IAS 7 Statement of Cash Flows.

5:8.2 Calculating changes in working capital and cash

Accounting · Duodécimo

Propósito: Applies methods to develop the analysis of the working capital and statements of change in the financial position based on the working capital.

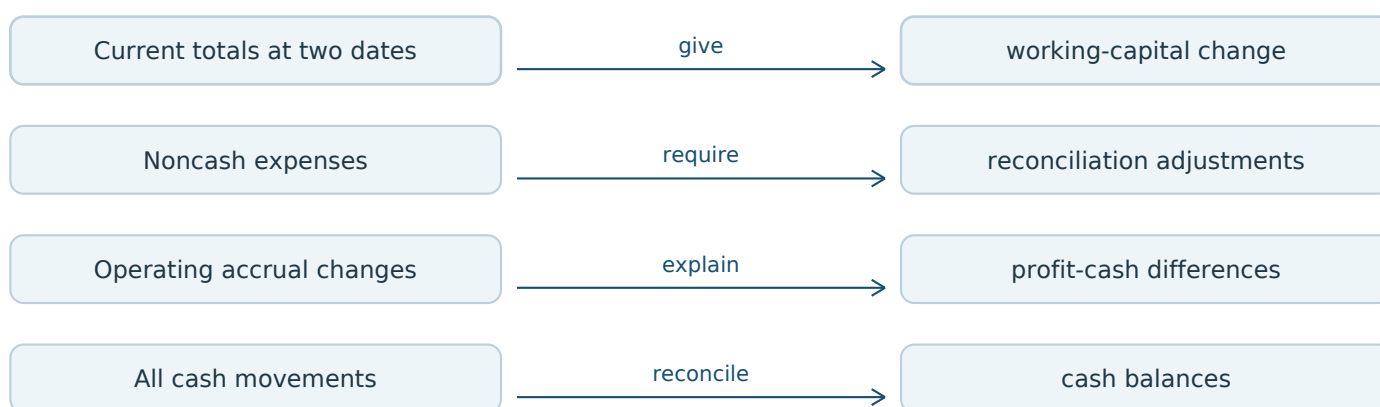

Compare positions consistently

Prepare current-asset and current-liability totals at the beginning and end using consistent classifications. Net working capital is the difference at each date; the change is ending minus beginning. An increase in a current asset increases net working capital if no offsetting current liability changes. An increase in a current liability decreases it if current assets do not change. Analyze the full transaction, not one line: paying a current debt with cash affects both sides.

Reconcile cash through stated adjustments

A simplified indirect operating-cash reconciliation adjusts the stated starting profit measure for noncash items and operating accrual changes. Under the cases here, depreciation is added back, an increase in trade receivables is subtracted, and an increase in trade payables is added, with no other effects. State the period, applicable reporting basis and adjustments rather than assuming one short formula covers all entities and standards changes. Investing and financing cash flows are then considered separately. A correct total should reconcile beginning and ending cash after all stated movements.

Mapa conceptual explicado

Calculate the effect of both sides of each transaction and use only the adjustments stated in the exercise.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Beginning current assets are 700 and current liabilities 400; ending amounts are 850 and 450. What is the increase in net working capital?

Solución razonada. 100. Beginning 300; ending 400; increase 100.

2. Caso 2 · Aplicación guiada

A simplified reconciliation starts from profit 500, adds depreciation 80 and subtracts an increase in receivables of 60. No other adjustments apply. What is operating cash flow?

Solución razonada. 520. $500 + 80 - 60 = 520$.

3. Caso 3 · Aplicación guiada

Beginning cash is 200; operating cash inflow 150, investing outflow 100 and financing inflow 80. What is ending cash?

Solución razonada. 330. $200 + 150 - 100 + 80 = 330$.

4. Case 4 · Current exchange

Cash of 100 is used to buy inventory, with no other effects.

Solución razonada. One current asset decreases and another increases by 100, so net working capital is unchanged even though cash falls.

5. Case 5 · Long-term use

Equipment is bought for cash of 250, with no liability.

Solución razonada. Current assets fall by 250 and a noncurrent asset rises. Net working capital falls by 250 under the stated classifications.

IFRS Foundation. IAS 7 Statement of Cash Flows.

5:9.1 Tools for financial statement analysis

Accounting · Duodécimo

Propósito: Recognizes the tools used to carry out financial analysis statements.

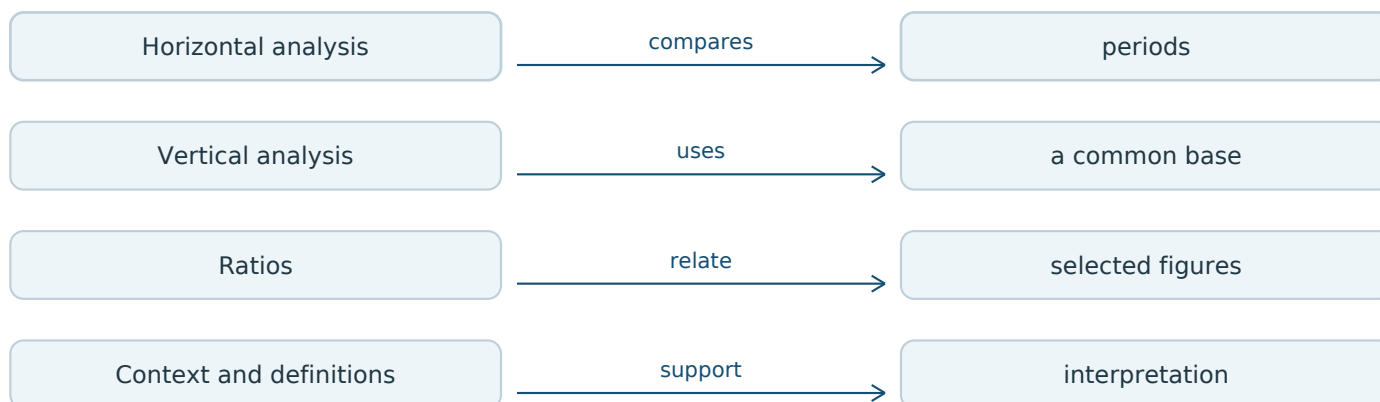

Different tools answer different questions

Horizontal analysis compares amounts over time and can express absolute or percentage changes. Vertical or common-size analysis expresses statement items relative to a base, such as sales or total assets. Ratios relate selected figures to study liquidity, profitability, activity or financing. Trend analysis extends comparisons across periods. These tools organize evidence; they do not identify a cause automatically. The analyst must read accounting policies and circumstances behind the numbers.

Make comparisons meaningful

Use consistent periods, currency units and definitions. A flow such as annual sales is often compared with an average balance when the ratio calls for it. A zero denominator makes an ordinary ratio undefined, not automatically zero. Percentage growth from a very small base can appear dramatic while the absolute increase is modest. Compare similar activities and consider seasonality, one-time events and policy changes. A useful analysis reports the calculation, the interpretation and its limits instead of treating one ratio as a universal verdict.

Mapa conceptual explicado

A tool simplifies a comparison; it does not remove the need for comparable data.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Sales increase from 400 to 500. What is the percentage increase?

Solución razonada. 25%. $(500 - 400) \div 400 \times 100 = 25\%$; the earlier amount is the base.

2. Caso 2 · Aplicación guiada

In a common-size income statement using sales as 100%, expenses are 60 and sales are 200. What percentage represents those expenses?

Solución razonada. 30%. $60 \div 200 \times 100 = 30\%$.

3. Caso 3 · Aplicación guiada

Which tool compares selected financial figures through relationships such as current assets divided by current liabilities?

Solución razonada. Ratio analysis. A ratio relates figures to address an analytical question.

4. Case 4 · Currency

An analyst divides a CRC asset balance by a USD liability without conversion.

Solución razonada. Put the figures on a consistent currency basis under the case before interpreting the ratio.

5. Case 5 · Zero base

Last year's amount is zero and this year's is 50.

Solución razonada. The usual percentage-change formula cannot divide by zero. Report the absolute change and explain the limitation.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

5:9.2 Interpreting financial ratios

Accounting · Duodécimo

Propósito: Interprets the results obtained from the financial ratios.

Calculate the stated measure

The current ratio divides current assets by current liabilities. A quick ratio usually excludes inventory and other less liquid current items according to its stated definition. Net profit margin divides net profit by sales. Inventory turnover commonly divides cost of goods sold by average inventory. The exact definition matters: sales divided by inventory is not the same measure as cost divided by inventory. State numerator, denominator and units before interpreting a result.

Interpret without overclaiming

A high current ratio may reflect strong short-term resources, but it may also include obsolete stock or slow receivables. A higher margin can reflect pricing, cost control or a one-time event; examine evidence before attributing a cause. Fast turnover can reduce funds tied up but may coexist with stockouts. Compare periods and suitable peers, and combine liquidity, profitability and activity indicators. One favorable ratio does not prove that all risks are low or that cash will be available on each due date.

Mapa conceptual explicado

A ratio is a starting point for questions, not a substitute for examining the underlying balances.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Current assets are 600 and current liabilities 300. What is the current ratio?

Solución razonada. 2 times. $600 \div 300 = 2$.

2. Caso 2 · Aplicación guiada

Net profit is 90 and sales are 1500. What is net profit margin?

Solución razonada. 6%. $90 \div 1500 \times 100 = 6\%$.

3. Caso 3 · Aplicación guiada

Cost of goods sold is 12000. Beginning inventory is 5000 and ending inventory 7000; use their simple average. What is inventory turnover?

Solución razonada. 2 times. Average inventory = 6000; turnover = $12000 \div 6000 = 2$.

4. Case 4 · Composition

Two firms have the same current ratio, but one has mostly cash and the other mostly obsolete stock.

Solución razonada. Their liquidity quality differs. Inspect composition and recoverability rather than treating the identical ratio as identical payment capacity.

5. Case 5 · Interpretation

Inventory turnover rises while stockouts increase.

Solución razonada. Investigate whether lower stock harms service. A higher turnover is not automatically an improvement in all objectives.

DGEC. Tabla oficial 2026, especialidad 3001, página 8.

6:1.1 Leadership in a small or medium enterprise

Manufacturing Management · Undécimo

Propósito: Recognizes concept of leaders, types of leaders and functions of leaders.

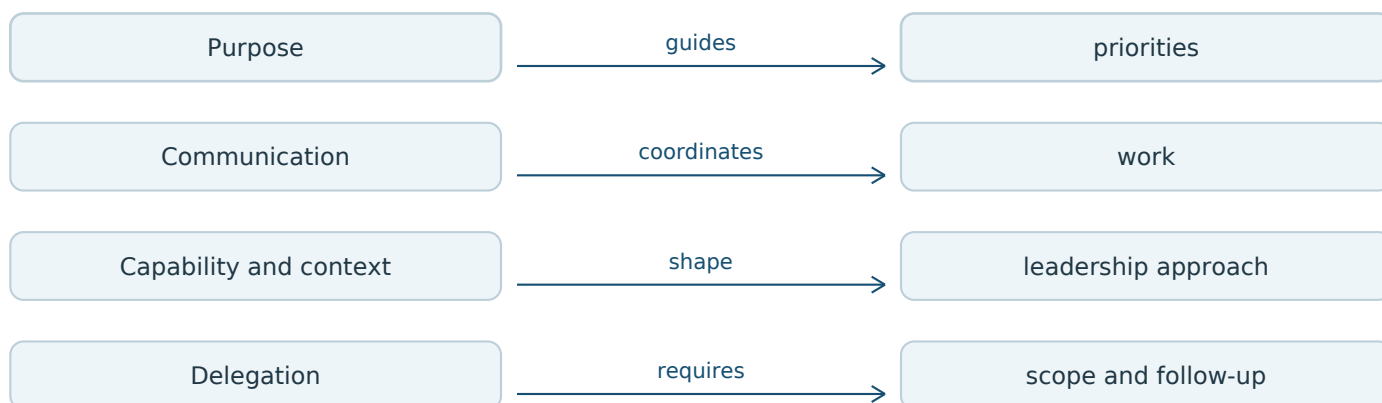

Guide people toward a purpose

Leadership involves influencing and supporting people toward shared work objectives. A formal manager has assigned authority, while leadership can also emerge from expertise and trust. Leaders clarify priorities, coordinate work, communicate expectations, develop capability and respond to obstacles. A title alone does not guarantee that these functions are performed. In an SME, close relationships can support quick communication, but roles and decisions still need clarity.

Adapt the approach to the situation

A directive approach sets clear decisions and instructions; a participative approach seeks team input; a delegating approach gives capable people defined room to decide. None is universally best for every task. Urgency, competence, risk and the need for consultation affect the choice. Transformational leadership emphasizes shared direction and development, while transactional practices emphasize agreed performance and consequences. Delegation retains appropriate accountability and support. A leader should evaluate the effects on quality and people rather than equating silence with agreement or activity with results.

Mapa conceptual explicado

Leadership connects direction, support and accountability; the approach should fit the task.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which action illustrates leadership rather than only holding a title?

Solución razonada. Clarifying the goal and helping the team remove a work obstacle. Leadership supports coordinated progress toward a purpose.

2. Caso 2 · Aplicación guiada

A manager invites staff to analyze options before choosing a workflow. Which approach is most evident?

Solución razonada. Participative leadership. The team contributes to the decision process.

3. Caso 3 · Aplicación guiada

What is needed when delegating a task?

Solución razonada. A clear scope, appropriate authority and agreed follow-up. Delegation works when people know what they can decide and what outcomes matter.

4. Case 4 · Urgency

A trained team must follow a defined emergency procedure promptly.

Solución razonada. Clear direction can be appropriate for that situation; it does not imply that consultation is unnecessary for all routine decisions.

5. Case 5 · Learning

A capable worker is given a new responsibility but lacks one critical skill.

Solución razonada. Provide training or support and clarify limits instead of assuming that confidence alone replaces capability.

OpenStax. Principles of Accounting, Volume 2: Managerial Accounting.

6:2.1 Inventory systems, lead time and storage

Manufacturing Management · Undécimo

Propósito: Recognizes the importance of administrative inventory systems in a company as in delay time, line, locations, suppliers and storage of raw material.

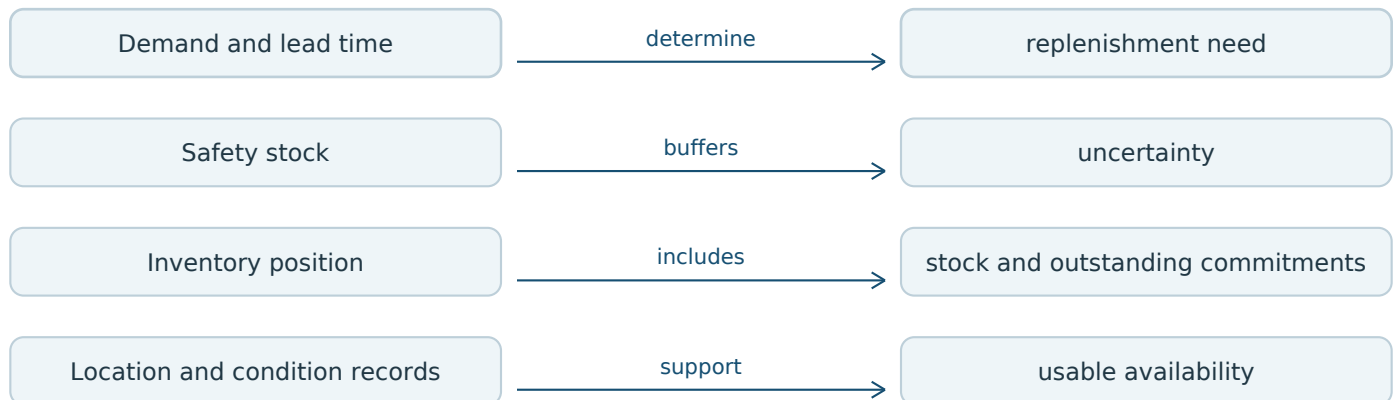

Plan availability

An inventory system coordinates demand, orders, receipts, storage and use. Lead time is the interval between ordering and availability under the case's definition; it is not the same as demand rate or time on a shelf. A reorder point indicates when replenishment is triggered. With steady demand and the stated assumptions, reorder point = demand during lead time + safety stock. Safety stock provides a buffer against relevant uncertainty, but it has a holding cost and cannot solve every supplier problem.

Track position and location

Inventory position can be defined as on-hand quantity plus outstanding orders minus backorders; this helps avoid ordering the same requirement twice. Record item locations, lot or expiry information where relevant, and restrictions on use. FIFO as a physical flow differs from a cost formula, and expiry-sensitive goods may require first-expiring-first-out handling. Supplier reliability, storage conditions, queues at receiving and production schedules affect availability. A large recorded balance is not useful if goods cannot be located, are damaged or are committed elsewhere. Counts and reconciliations test the system's reliability.

Mapa conceptual explicado

The system must know how much exists, where it is, what is usable and what is already on order.

Cinco casos para comprender y aplicar

1. Caso 1 • Aplicación guiada

Daily demand is 20 units, lead time five days and safety stock 30 units. What is the reorder point under the stated model?

Solución razonada. 130 units. $20 \times 5 + 30 = 130$.

2. Caso 2 • Aplicación guiada

On-hand stock is 80, outstanding orders 50 and backorders 20. What is inventory position under the stated definition?

Solución razonada. 110 units. $80 + 50 - 20 = 110$.

3. Caso 3 • Aplicación guiada

For expiry-sensitive goods, which physical picking rule targets the earliest expiry date?

Solución razonada. First-expiring-first-out. FEFO focuses on expiry rather than only receipt date.

4. Case 4 • Condition

The system shows 100 units, but 25 are damaged and not usable.

Solución razonada. Available usable stock is not the same as the unqualified recorded quantity; separate status and investigate treatment.

5. Case 5 • Bottleneck

Goods arrive on time but wait several days for receiving inspection.

Solución razonada. Include the internal delay when planning availability; supplier arrival is not always the point at which production can use the stock.

Fuentes para ampliar y cotejar

OpenStax. Principles of Accounting, Volume 2: Managerial Accounting.

6:3.1 Standard cost rates and cost cards

Manufacturing Management · Undécimo

Propósito: Adequately calculates rates for each element of cost using bases.

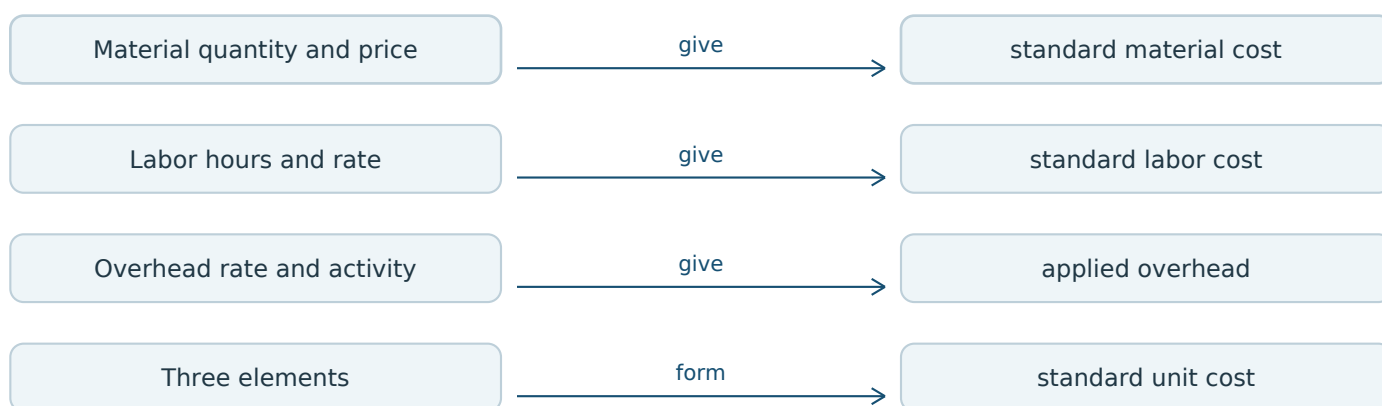

Build each element from its base

A standard cost card states the expected quantity or time and price or rate for a defined product under specified operating assumptions. Direct material cost combines standard material quantity and standard price. Direct labor cost combines standard labor hours and standard hourly rate. Applied manufacturing overhead uses an appropriate activity base and a predetermined rate, such as budgeted overhead divided by budgeted machine hours. Units must match: a rate per machine hour cannot be applied indiscriminately to labor hours.

Use standards as a comparison

Total standard unit cost adds the three elements once. A standard is an expected benchmark under stated conditions, not proof of actual cost. Compare the allowance for actual output with actual resource use to examine differences. Distinguish changes in quantity, efficiency and price instead of attributing every gap to worker performance. Revise standards through an authorized process when justified, while preserving the basis used for past comparisons. A standard-cost system needs reliable quantities, rates and activity records; precise formatting cannot compensate for an unsuitable base.

Mapa conceptual explicado

Each rate belongs to a defined resource base, and the cost card adds the resulting amounts.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

A product requires 3 kg of material at 4 per kg. What is its standard direct material cost?

Solución razonada. 12. $3 \times 4 = 12$.

2. Caso 2 · Aplicación guiada

Budgeted manufacturing overhead is 30000 and the base is 6000 machine hours. What predetermined rate results?

Solución razonada. 5 per machine hour. $30000 \div 6000 = 5$ per machine hour.

3. Caso 3 · Aplicación guiada

An overhead rate is stated per machine hour. Which base should be used to apply it?

Solución razonada. The relevant number of machine hours. The rate's denominator determines the matching activity unit.

4. Case 4 · Full card

A unit needs 2 kg at 5, one labor hour at 7 and two machine hours at overhead rate 3.

Solución razonada. Standard unit cost = $2 \times 5 + 1 \times 7 + 2 \times 3 = 23$.

5. Case 5 · Interpretation

Actual material cost exceeds standard.

Solución razonada. Investigate price, usage and output assumptions separately; the total difference alone does not identify its cause.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 9.

OpenStax. Principles of Accounting, Volume 2: Managerial Accounting.

6:4.1 Continuous production and process costing

Manufacturing Management · Undécimo

Propósito: Distinguishes introductory concepts of costs for continuous or departmental process.

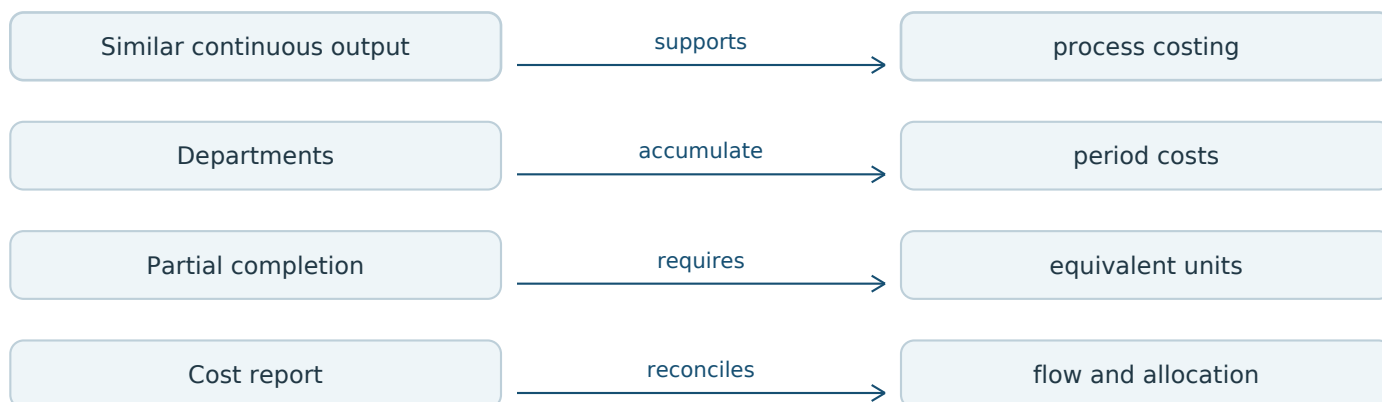

Accumulate by process

Process costing accumulates costs by process or department for a period when production consists of many similar units. Job-order costing instead traces costs to distinguishable jobs or orders. The choice follows production characteristics rather than company size alone. A process may receive units from an earlier department and transfer them to another; transferred-in costs must be tracked without counting them twice. Work remaining at the end of a period creates the need to distinguish physical units from completed work.

Equivalent units

Equivalent production expresses partial units as completed-unit amounts for each cost element. Materials may be added at one point while conversion occurs throughout processing, so completion percentages can differ. Under the weighted-average cases used here, equivalent units combine completed units and the equivalent work represented by ending work in process. Beginning costs and current costs are pooled for the corresponding unit-cost calculation. FIFO uses a different treatment of beginning work; identify the method before computing. A production-cost report reconciles physical flow, equivalent work and assigned costs.

Mapa conceptual explicado

Physical units describe objects; equivalent units describe the amount of work completed on them.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Which operation is most suited to process costing?

Solución razonada. Continuous production of many similar units through the same stages. Process costing fits repeated, similar production accumulated by process.

2. Caso 2 · Aplicación guiada

There are 100 units in process at 40% conversion. How much equivalent conversion work do they represent?

Solución razonada. 40 equivalent units. $100 \times 0.40 = 40$.

3. Caso 3 · Aplicación guiada

Why may equivalent units for materials differ from those for conversion?

Solución razonada. Materials and conversion can be added at different stages or rates. The timing of each element determines the work represented.

4. Case 4 · Transfer

A department receives units with costs accumulated earlier and adds more work.

Solución razonada. Track transferred-in costs separately from new departmental costs so the total product cost includes each stage once.

5. Case 5 · Method

A problem includes beginning work in process but does not identify weighted average or FIFO.

Solución razonada. Clarify the method before choosing a formula; the same physical data can be treated differently.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 9.

OpenStax. Process costing.

IFRS Foundation. IAS 2 Inventories.

6:4.2 Summarizing production costs

Manufacturing Management · Undécimo

Propósito: Summarizes costs.

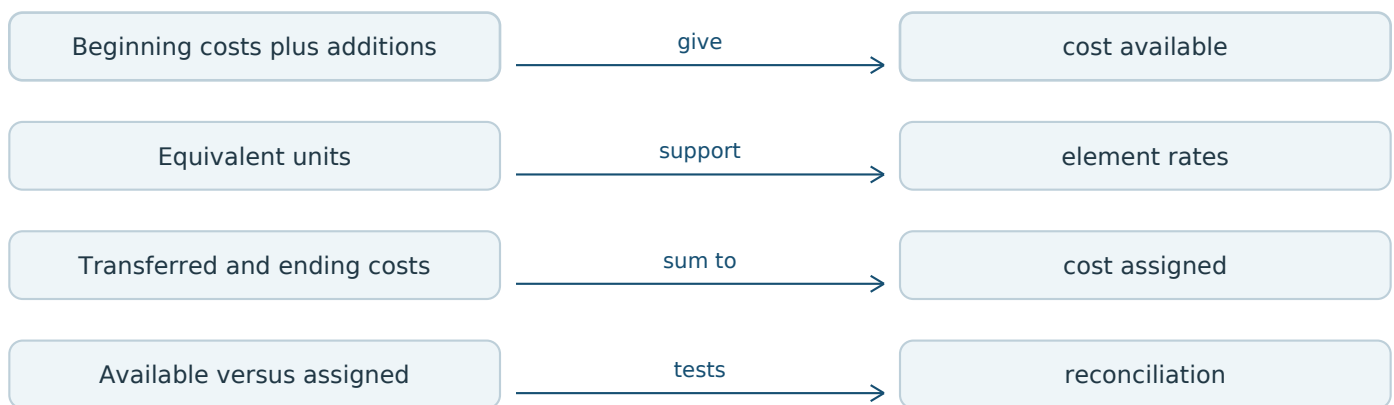

Reconcile cost available and cost assigned

A production-cost summary explains where the costs came from and where they were assigned. Costs to account for include beginning work in process and costs added during the period under the stated method. Costs accounted for include costs transferred out and ending work in process. The two totals should agree, apart from specified rounding. Materials, direct labor and manufacturing overhead must be included once; conversion groups labor and overhead when the case uses that grouping.

Follow the units and rates

For weighted-average process costing, calculate equivalent units separately where completion differs, then divide each element's pooled cost by its equivalent units. Apply those rates to completed output and ending work. Do not multiply all incomplete units by a full finished-unit cost unless they are complete in every element. A summary of finished production can also be expressed as beginning work in process plus manufacturing costs minus ending work in process, when the exercise supplies those amounts directly. Trace transfers consistently through later departments and finished-goods records.

Mapa conceptual explicado

The summary must explain the whole available cost without losing or duplicating a stage.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Manufacturing costs are materials 8000, direct labor 7000 and overhead 5000. What is total manufacturing cost added?

Solución razonada. 20000. $8000 + 7000 + 5000 = 20000$.

2. Caso 2 · Aplicación guiada

Beginning work in process costs 500, added costs 3500 and ending work in process 600. What cost is transferred out under the case?

Solución razonada. 3400. $500 + 3500 - 600 = 3400$.

3. Caso 3 · Aplicación guiada

Available costs are 9000. Transferred costs are 7600 and ending work in process 1400. What does the comparison show?

Solución razonada. The assigned total reconciles to available costs. $7600 + 1400 = 9000$.

4. Case 4 · Rates

Materials cost 3000 for 750 equivalents and conversion costs 2400 for 600 equivalents.

Solución razonada. Each rate is 4; a fully completed unit costs 8 across the two elements. Different denominators reflect different equivalent work.

5. Case 5 · Finished goods

Finished goods begin at 1000, completed production costs 6000 and ending finished goods are 1500.

Solución razonada. With no other adjustments, cost of goods sold = $1000 + 6000 - 1500 = 5500$.

OpenStax. Process costing.

IFRS Foundation. IAS 2 Inventories.

6:5.1 Joint products, co-products and by-products

Manufacturing Management · Undécimo

Propósito: Comments about countable field processes of combined products, by-products and co-products.

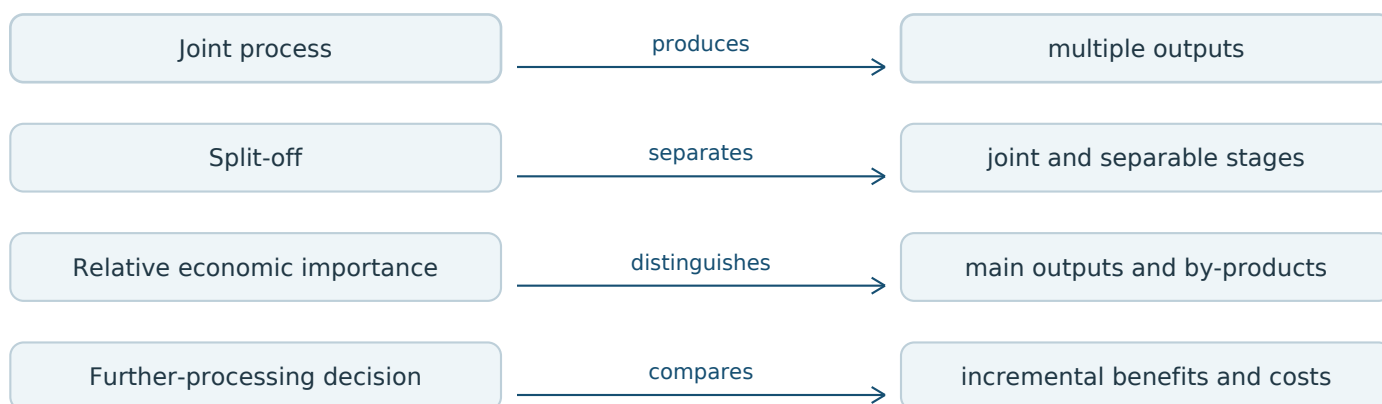

One process, several outputs

A joint process produces more than one output before the outputs become separately identifiable at the split-off point. Joint costs are incurred before that point. Separable costs arise afterward for a specific output. Outputs with significant relative economic importance may be treated as joint products or co-products in the terminology used by the course; a by-product has relatively minor economic significance. Physical size alone does not determine that distinction.

Allocation and decisions

Joint costs must be assigned for appropriate inventory and reporting purposes using a rational, consistent method. An allocation does not prove that one product caused an independently avoidable share of the common cost. For a decision to process an existing output further after split-off, compare incremental revenue with incremental separable costs under the stated assumptions; the already incurred joint cost is not changed by that later decision. By-product treatment depends on significance and the accounting policy; an immaterial by-product's net realizable value may be deducted from the main product's cost under the applicable method.

Mapa conceptual explicado

An allocation used for reporting and a cost relevant to a later decision are not necessarily the same.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

What is the split-off point?

Solución razonada. The point where outputs of a joint process become separately identifiable. Before split-off, costs belong to the common process.

2. Caso 2 · Aplicación guiada

A cost is incurred after split-off exclusively to finish product A. How is it classified?

Solución razonada. A separable cost of product A. Its timing and traceability distinguish it from the common pre-split cost.

3. Caso 3 · Aplicación guiada

What distinguishes a by-product in this introductory classification?

Solución razonada. Relatively minor economic importance compared with the main outputs. Economic significance, not size alone, guides the distinction.

4. Case 4 · Further processing

An output can be sold now for 100 or processed further for an additional cost of 15 and sold for 125.

Solución razonada. Incremental revenue is 25 and extra cost 15, so further processing adds 10 under the stated assumptions.

5. Case 5 · Common cost

A manager calls every allocated joint cost avoidable when considering further processing.

Solución razonada. Separate already incurred common costs from costs changed by the decision. Allocation alone does not establish avoidability.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 9.

OpenStax. Process costing.

IFRS Foundation. IAS 2 Inventories.

6:5.2 Methods for allocating joint costs

Manufacturing Management · Undécimo

Propósito: Applies methods to assign combined costs.

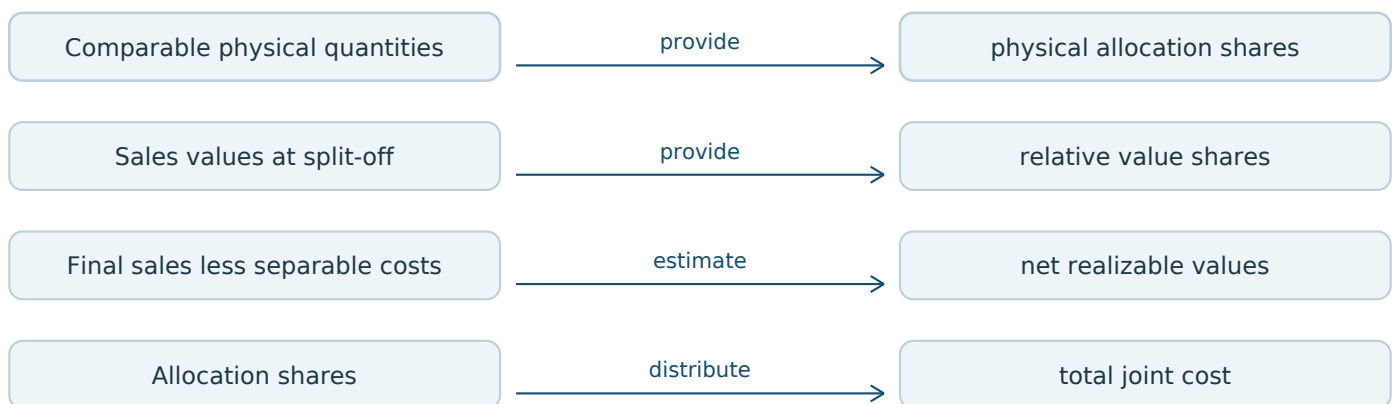

Physical and sales-value methods

A physical-measure method allocates joint cost in proportion to comparable quantities, such as kilograms of each output. It requires a meaningful common measure and does not reflect different selling values. A relative sales-value-at-split-off method allocates in proportion to each output's sales value at that point. Multiply the total joint cost by the output's share of the chosen allocation base. Shares should sum to one and allocated costs should reconcile to the total.

When split-off values are unavailable

A net-realizable-value approach may use final sales value less the specified separable processing and selling costs to estimate a value at split-off. State which deductions the exercise requires rather than treating gross final sales as net value. Allocate joint costs using those net amounts and then add each output's own separable costs if a total output cost is requested. Different allocation methods can produce different product costs; that does not change total joint cost or by itself decide whether further processing is profitable.

Mapa conceptual explicado

Choose the stated base, calculate each share and reconcile the total before interpreting product costs.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Joint cost is 5000. Outputs are A 300 kg and B 200 kg. Using physical quantities, what is allocated to A?

Solución razonada. 3000. A receives $300 \div 500$ of $5000 = 3000$.

2. Caso 2 · Aplicación guiada

Joint cost is 6000. Sales values at split-off are A 12000 and B 8000. What is allocated to B by relative sales value?

Solución razonada. 2400. B's share is $8000 \div 20000 = 40\%$; $6000 \times 0.40 = 2400$.

3. Caso 3 · Aplicación guiada

An output's final sales value is 9000 and specified separable costs are 2000. What net amount is used in the stated NRV allocation base?

Solución razonada. 7000. $9000 - 2000 = 7000$.

4. Case 4 · Reconciliation

Joint cost of 10000 is allocated using shares 60% and 40%.

Solución razonada. Allocations are 6000 and 4000, totaling 10000. Adding separable costs later does not alter this reconciliation of joint cost.

5. Case 5 · Incompatible units

A proposed physical base adds liters of one output and kilograms of another without conversion.

Solución razonada. Establish a meaningful common measure or use an appropriate alternative; unlike units cannot be added as if comparable.

OpenStax. Process costing.

IFRS Foundation. IAS 2 Inventories.

7:1.1 Physical and mental workload

Business management · Undécimo

Propósito: Differs among physical and mental load.

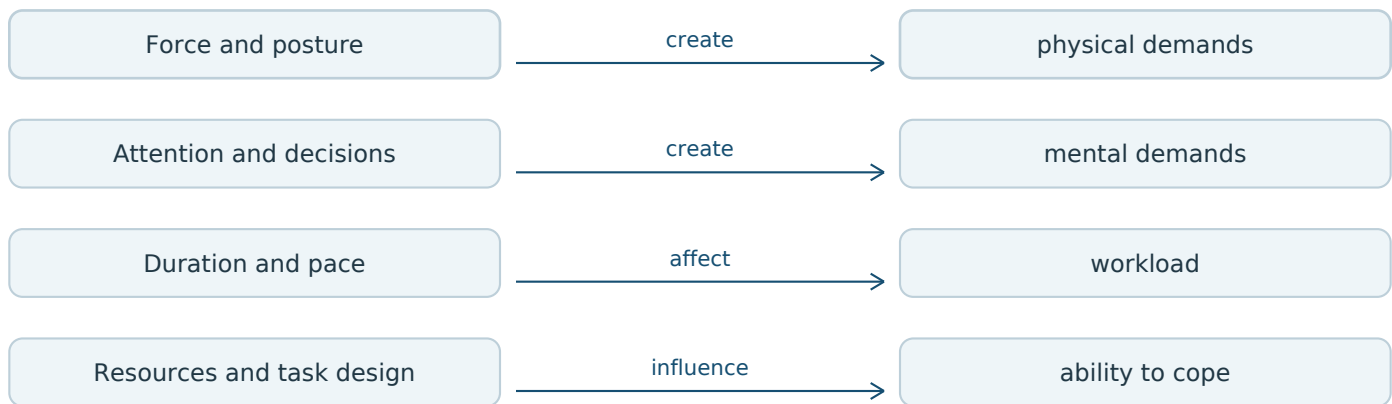

Different demands can occur together

Physical workload includes demands such as lifting, repetition, force and sustained posture. Mental workload includes attention, memory, reasoning, decision-making and processing information. Sitting at a computer does not eliminate physical demands, and manual work can also require intense mental attention. The distinction helps identify what creates the demand; it does not rank one type of work as more important than another.

Match demands and resources

Workload depends on the task, its duration, pace, available tools and the person's resources and preparation. Interruptions, conflicting instructions and unclear priorities can increase mental demands without increasing the number of transactions completed. A fixed posture can create physical strain even when little movement is visible. Assessment should examine the work arrangement and involve the people doing the task. Training can improve capability, but it cannot compensate for every excessive demand, unsuitable workstation or conflicting deadline. Appropriate control may require redesigning tasks, schedules or resources.

Mapa conceptual explicado

A task can impose both types of demand; identify their sources before choosing a control.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Holding the neck in one position for a long period is mainly an example of which demand?

Solución razonada. A physical postural demand. Sustained posture is a physical exposure even without heavy lifting.

2. Caso 2 · Aplicación guiada

Reconciling conflicting records while receiving frequent interruptions mainly increases which demand?

Solución razonada. Mental attention and decision-making demand. The task requires retaining and processing information while switching attention.

3. Caso 3 · Aplicación guiada

Can one task involve both physical and mental workload?

Solución razonada. Yes; the two types can coexist. For example, repetitive data entry can combine posture demands and sustained attention.

4. Case 4 · Interruptions

A clerk receives conflicting urgent requests from three supervisors.

Solución razonada. Clarify priorities and coordination; asking the clerk to concentrate harder does not resolve contradictory demands.

5. Case 5 · Task design

A worker repeatedly reaches for heavy files above shoulder level.

Solución razonada. Review storage and handling arrangements. The control should address the physical demand at its source.

Fuentes para ampliar y cotejar

DGEC. Tabla oficial 2026, especialidad 3001, página 10.

NIOSH. Stress and Work.

7:1.2 Workload effects on people and productivity

Business management · Undécimo

Propósito: Describes consequences of physical and mental workload on people and productivity.

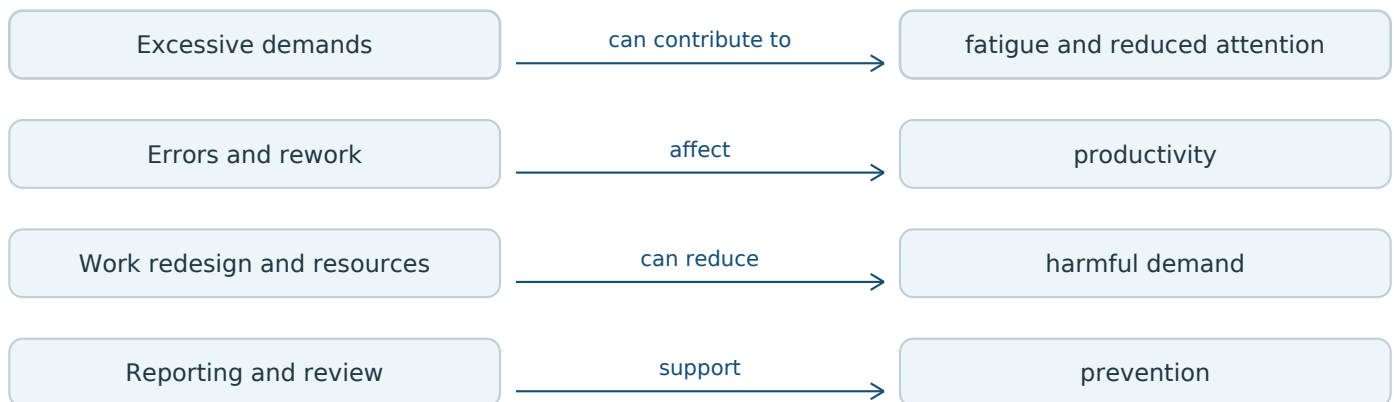

Recognize patterns without diagnosing

Excessive or poorly managed demands can contribute to fatigue, discomfort, reduced attention and errors. These effects can harm both well-being and the quality of work. A rise in corrections during long reporting shifts is a signal to investigate, not proof of one medical condition or of employee carelessness. Consider exposure, schedules, tools, staffing and other explanations. People may experience the same arrangement differently, so participation and reporting channels matter.

Improve the work system

Useful responses can include clearer priorities, appropriate staffing, task variation, workable schedules and suitable equipment. Short-term increases in output may be offset by rework, absence or poor decisions if the pace cannot be sustained. A control should be assessed for whether it reduces the demand or improves resources, not only whether it tells employees to tolerate more. Encourage timely reporting and appropriate assessment of persistent symptoms. Evaluate quality, completion time and well-being together; hiding errors or discouraging reports weakens the evidence needed to improve.

Mapa conceptual explicado

Sustainable performance includes quality and people's capacity to continue working safely.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Errors rise near the end of repeated long closing shifts. What is a sound response?

Solución razonada. Investigate workload, scheduling and process conditions. The pattern is evidence for investigation, not a complete explanation by itself.

2. Caso 2 · Aplicación guiada

Why can a faster pace fail to improve overall productivity?

Solución razonada. Additional errors and rework can offset the apparent time saved. Performance must include the quality and cost of completing the work.

3. Caso 3 · Aplicación guiada

Which action addresses an organizational source of overload?

Solución razonada. Clarify conflicting priorities and provide suitable resources. Changing task conditions can reduce the mismatch between demands and resources.

4. Case 4 · Reporting

Staff stop reporting discomfort because every report is dismissed.

Solución razonada. The absence of reports no longer provides reliable evidence of a safe arrangement. Restore an appropriate reporting and review process.

5. Case 5 · Evaluation

A new schedule increases completed transactions but also increases corrections.

Solución razonada. Compare net performance, rework and effects on people rather than celebrating only the gross transaction count.

8:1.1 Ethical principles in auditing

Accounting Decision Tools · Duodécimo

Propósito: Identifies principles that regulate the auditor.

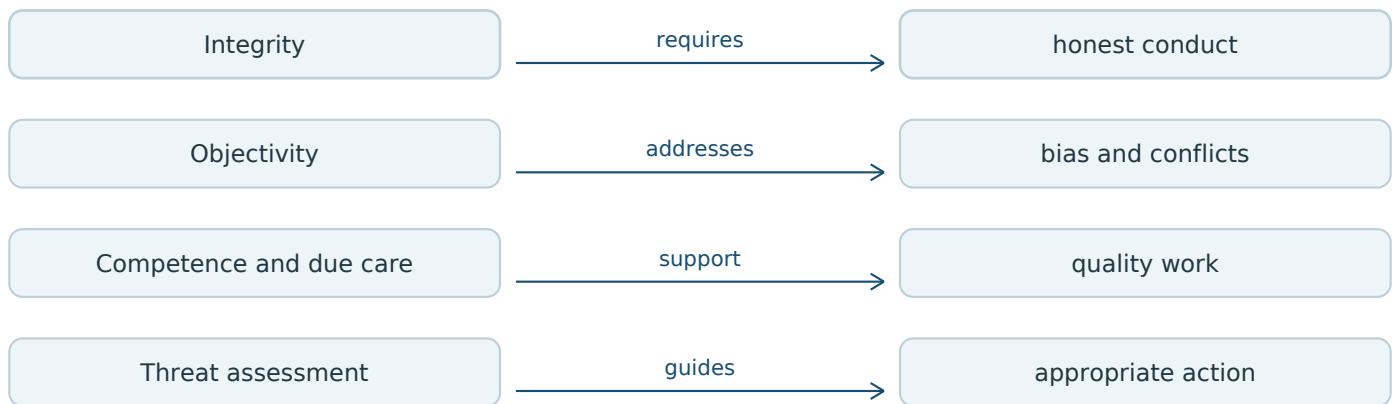

Professional responsibility

Ethical conduct supports confidence in accounting and assurance work. The IESBA framework identifies fundamental principles including integrity, objectivity, professional competence and due care, confidentiality, and professional behavior. Integrity requires honest conduct; objectivity requires attention to bias and conflicts. Competence and due care involve maintaining relevant capability and performing work diligently. Confidentiality limits unauthorized use or disclosure, while recognizing applicable legal or professional duties.

Identify and address threats

Independence requirements are especially relevant to audit and assurance. A financial interest, a close relationship, pressure from a client or reviewing one's own work can create threats that must be identified, evaluated and addressed through the applicable framework. Simply declaring oneself fair does not resolve the circumstances. Document the issue and use authorized consultation or safeguards where appropriate; some circumstances require declining or ending an activity rather than relying on a weak safeguard. Professional skepticism means questioning and assessing evidence, not assuming every person is dishonest.

Mapa conceptual explicado

Ethics requires action on circumstances that threaten sound judgment, not only knowledge of principle names.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

An auditor is asked to omit a known error to keep the client satisfied. Which principle most directly calls for honesty in the response?

Solución razonada. Integrity. Integrity requires honest conduct rather than deliberate misrepresentation.

2. Caso 2 · Aplicación guiada

An auditor lacks expertise for a specialized task. What reflects competence and due care?

Solución razonada. Obtain suitable expertise or support before undertaking work beyond capability. The work requires capability and diligent performance.

3. Caso 3 · Aplicación guiada

What does professional skepticism involve?

Solución razonada. Questioning and critically assessing relevant evidence. Skepticism supports balanced evaluation rather than blind trust or universal suspicion.

4. Case 4 · Conflict

A team member has a financial interest in the entity being audited.

Solución razonada. Identify and evaluate the threat under applicable independence requirements and take the required action; a private promise to be fair is insufficient.

5. Case 5 · Confidentiality

An acquaintance asks for unpublished client figures.

Solución razonada. Do not disclose without a proper basis. Consider applicable duties and authorized channels rather than informal curiosity.

IESBA. International Code of Ethics.

8:2.1 Internal control over company accounts

Accounting Decision Tools · Duodécimo

Propósito: Determines the means to achieve the internal control in corporate accounts.

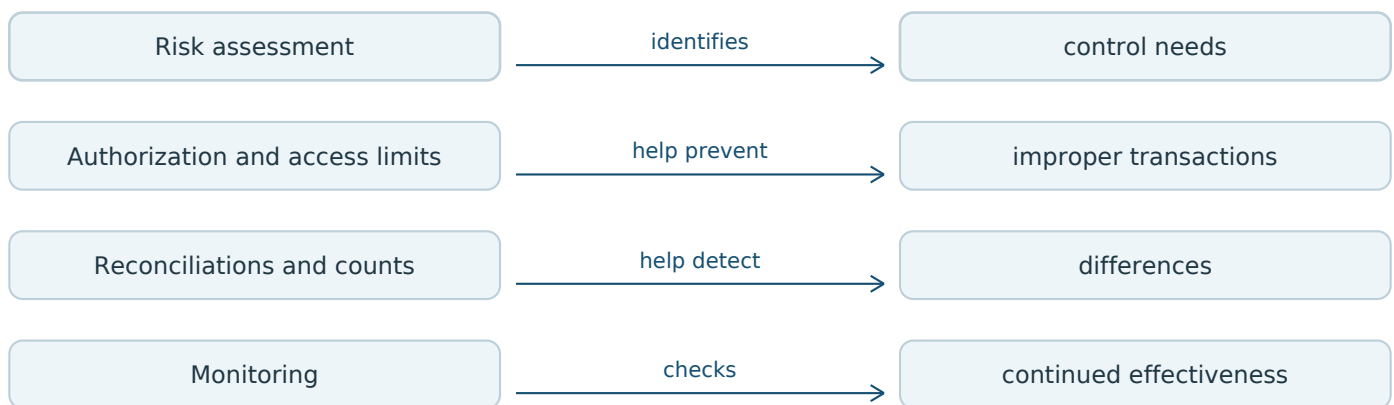

Control objectives and components

Internal control is a process that supports objectives related to operations, reporting and compliance. It provides reasonable assurance, not a guarantee that every error or fraud is impossible. A useful framework connects control environment, risk assessment, control activities, information and communication, and monitoring. A procedure is effective only if it addresses a relevant risk and is carried out as intended. A signed policy stored away from daily work is not evidence of operation by itself.

Examples across account types

Real or permanent accounts carry balances forward, such as assets and liabilities; nominal or temporary accounts, such as revenue and expense, are closed according to the accounting process. Controls support both. Cash reconciliation, inventory counts, authorization of payments, controlled access and review of journal entries serve different purposes. Preventive controls seek to stop a problem before it occurs; detective controls seek to identify it afterward. Small entities may use compensating independent review when full separation of duties is impractical, but the review must be substantive and documented.

Mapa conceptual explicado

A control must have a purpose, an accountable performer and evidence that it works.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

What level of assurance is generally associated with internal control?

Solución razonada. Reasonable assurance, with inherent limitations. Human error, collusion and other limitations prevent absolute assurance.

2. Caso 2 · Aplicación guiada

Which example is mainly a detective control?

Solución razonada. An independent bank reconciliation identifying unexplained differences. The reconciliation compares records to detect discrepancies.

3. Caso 3 · Aplicación guiada

Which is normally a permanent or real account?

Solución razonada. Accounts receivable. The receivable carries its balance forward rather than closing as a period result account.

4. Case 4 · Access

Every employee can edit supplier bank details.

Solución razonada. Limit access by responsibility and review authorized changes; broad access creates an avoidable payment risk.

5. Case 5 · Small entity

One clerk must perform several accounting tasks.

Solución razonada. Design a meaningful independent review of evidence and transactions rather than assuming small size removes control needs.

COSO. Internal Control.

8:2.2 Evaluate control situations and corrective action

Accounting Decision Tools · Duodécimo

Propósito: Interprets situations concerning the means to achieve a better internal control of the accounts of the company.

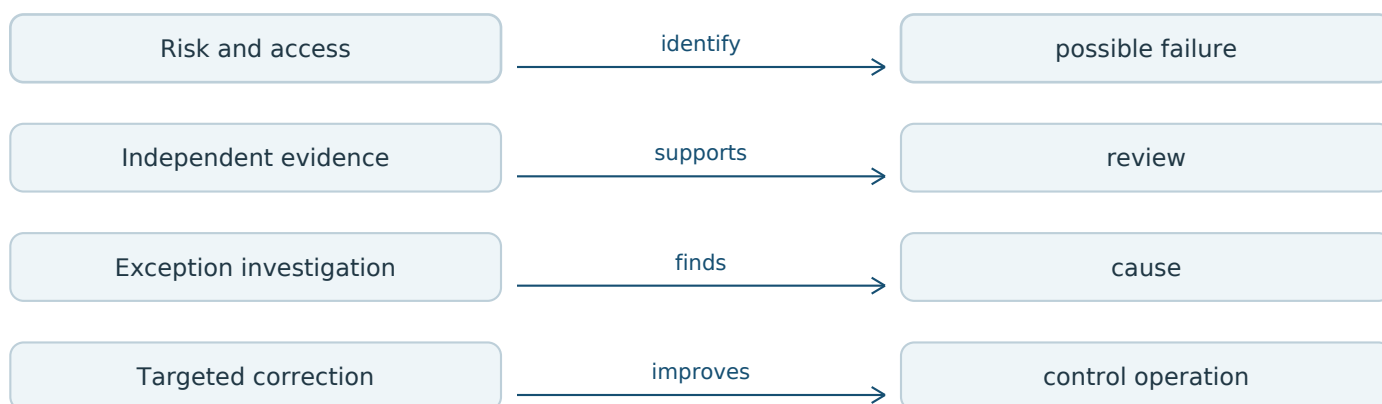

Trace the risk to the response

To evaluate a control case, identify the asset or information at risk, the person able to act, the evidence available and the point at which a check should occur. A payment can be recorded correctly yet sent to an unauthorized bank account. A reconciliation can exist but be prepared by the same person who concealed the difference. Ask what the control actually tests and whether its performer can review independently.

Design a workable correction

Separate incompatible duties where possible and add targeted review where separation is limited. Verify unusual requests through trusted channels, preserve supporting documents and investigate exceptions promptly. A correction should address the cause, not only remove the visible difference. Access is reviewed when roles change, and important amendments leave a trace. Controls have costs and practical constraints; choose a response that addresses the risk proportionately. More signatures do not necessarily improve control if every signer lacks the information needed to make a decision.

Mapa conceptual explicado

Evaluate who can do what, who checks it and what evidence makes the check meaningful.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

The cashier also prepares and approves the bank reconciliation without review. What improvement is most relevant?

Solución razonada. Independent review of the reconciliation and supporting evidence. An independent check can detect errors or concealment that self-review may miss.

2. Caso 2 · Aplicación guiada

A supplier bank-account change arrives by email. Which control addresses payment redirection risk?

Solución razonada. Verify the change using a previously trusted contact channel. Independent verification avoids relying solely on the potentially compromised request.

3. Caso 3 · Aplicación guiada

A former employee still has access to payroll after leaving. What should be corrected?

Solución razonada. Revoke the access and review relevant activity according to procedure. Access must follow current responsibilities and employment status.

4. Case 4 · Exception

A reconciliation has an unexplained difference carried forward every month.

Solución razonada. Investigate and resolve it with evidence; copying the same explanation does not establish a valid balance.

5. Case 5 · Review quality

Three people sign a payment summary without seeing invoices or approvals.

Solución razonada. Ensure reviewers receive and assess relevant evidence. Signature count is not the same as effective review.

COSO. Internal Control.

8:3.1 Projected profit and loss statements

Accounting Decision Tools · Duodécimo

Propósito: Mentions the projected profit and loss statement also the objectives of the projected profit and loss statement.

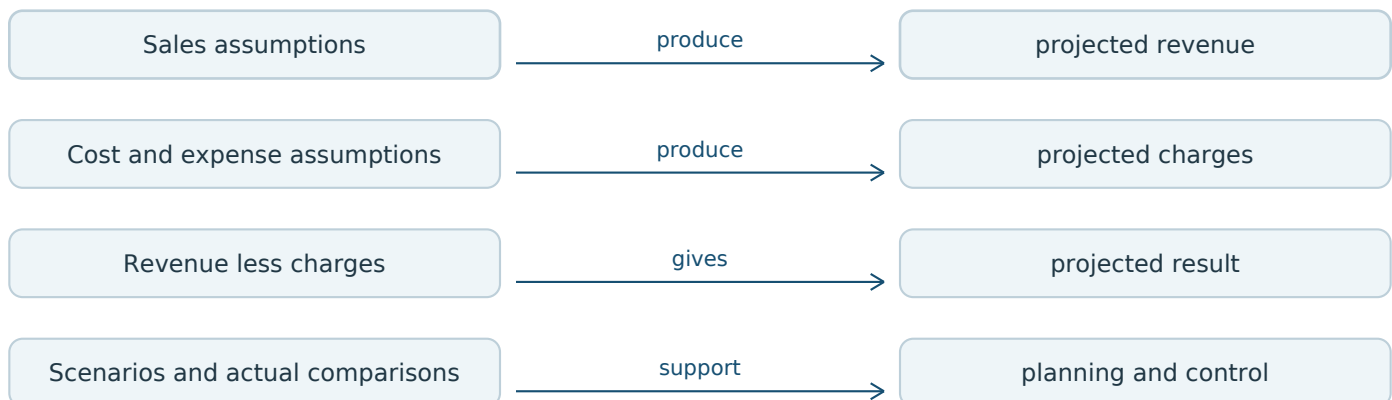

Plan the expected result

A projected profit and loss statement estimates revenue, cost of sales, expenses and the resulting profit or loss for a future period. It combines operating assumptions such as sales volume, selling price, unit cost and planned spending. It is not a guarantee and is not the same as a cash budget. Credit sales and noncash expenses can cause profit and cash to differ. The projection should identify the period, assumptions and included or excluded items.

Use the projection for decisions

Compare scenarios to understand sensitivity to demand, price and cost changes. Distinguish fixed costs within the relevant range from costs that vary with activity, while recognizing that real cost behavior may change outside that range. After the period, compare actual results with the projection and investigate meaningful differences. A favorable total may conceal a weak product or a one-time effect. Revising a forecast should improve the current estimate without erasing the original plan used for accountability and learning.

Mapa conceptual explicado

A projection is a reasoned estimate whose assumptions should be visible and testable.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Projected sales are 10000, cost of sales 6000 and operating expenses 2500. With no other items, what is projected profit?

Solución razonada. 1500. $10000 - 6000 - 2500 = 1500$.

2. Caso 2 · Aplicación guiada

What is a main purpose of a projected profit and loss statement?

Solución razonada. Estimate future operating results from stated assumptions. The statement supports planning and comparison, not certainty.

3. Caso 3 · Aplicación guiada

Why should the projection show its key assumptions?

Solución razonada. Users need to understand and test how the expected result was formed. Transparent assumptions support review and scenario analysis.

4. Case 4 · Cash

A projection includes sales collected two months later and depreciation.

Solución razonada. Prepare cash planning separately with collection and payment timing; projected profit is not the month's cash balance.

5. Case 5 · Comparison

Actual profit equals the projection, but sales and costs are both much higher.

Solución razonada. Analyze the components. An identical net figure can hide changes in volume, pricing or efficiency.

8:3.2 Methods for forecasting sales

Accounting Decision Tools · Duodécimo

Propósito: Determines methods to project sales.

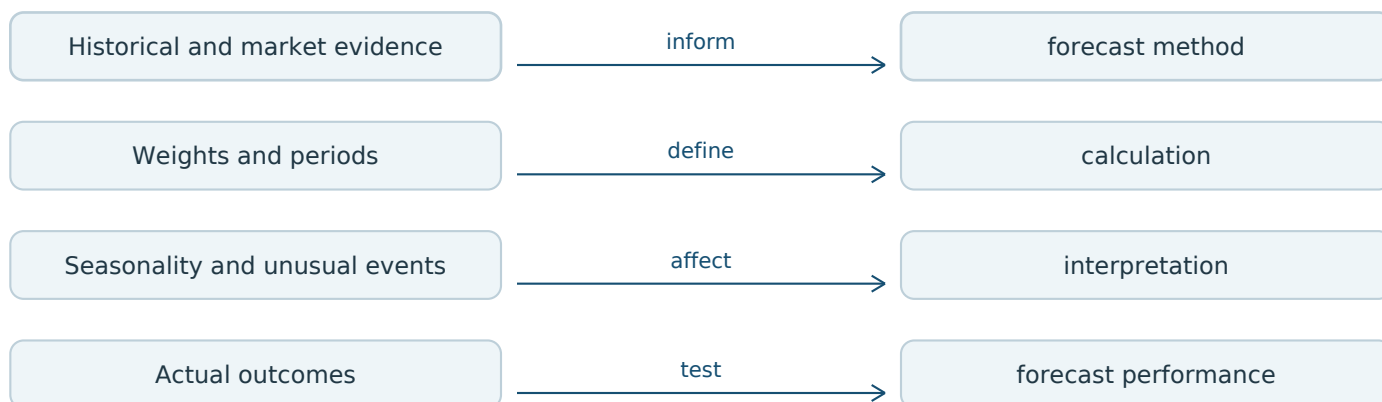

Use a method suited to the evidence

Sales forecasts can draw on historical patterns, market information, customer commitments and judgment. A simple moving average smooths recent observations by giving the selected periods equal weight. A weighted average gives stated weights to periods, which must sum to one. A trend method projects a pattern under assumptions; seasonal analysis considers recurring changes within the year. A naive forecast uses the latest observation as the next estimate. No method is best for every market or data set.

Check the forecast, not just the formula

Specify whether the forecast is in units or currency, and use comparable periods. Unusual promotions, stockouts and structural changes can make past sales a poor guide to underlying demand. Back-testing compares forecasts with later actual results using a consistent error measure. Forecasts should be updated when material evidence changes, while retaining the original version for evaluation. A precise calculation from unsuitable data can still be a poor forecast. Communicate uncertainty and scenarios instead of presenting an estimate as a guaranteed sale.

Mapa conceptual explicado

The method must fit the pattern and purpose; mathematical precision does not remove uncertainty.

Cinco casos para comprender y aplicar

1. Caso 1 · Aplicación guiada

Sales in the last three comparable months were 100, 120 and 140 units. What is the three-month simple moving-average forecast?

Solución razonada. 120 units. $(100+120+140) \div 3 = 120$.

2. Caso 2 · Aplicación guiada

A weighted forecast uses 0.6 for the latest sales of 200 and 0.4 for the previous sales of 150. What is the forecast?

Solución razonada. 180. $0.6 \times 200 + 0.4 \times 150 = 180$.

3. Caso 3 · Aplicación guiada

What does a seasonal sales pattern describe?

Solución razonada. A recurring pattern associated with parts of a year or another defined cycle. Seasonality is recurring variation, distinct from one-time events and long-term trend.

4. Case 4 · Stockout

Recorded sales fall because the product was unavailable for half the month.

Solución razonada. Sales may understate demand; consider the stockout before extending the lower figure as a market trend.

5. Case 5 · Validation

Two methods are available, but only their formulas are compared.

Solución razonada. Test their forecasts against actual outcomes over relevant periods and assess whether conditions are comparable.
